## 1 INTRODUCTION

---

The **3M™ Petrifilm™ Enterobacteriaceae Count Plate (EB)** was validated in September 1997 (Certificate number 3M 01/06 - 09/97) for human food products.

Date	Study	Expert laboratory	Standards used
<b>September 1997</b>	Initial validation	ADRIA	/
<b>December 2001</b>	Renewal study	ADRIA	/

<b>June 2021</b>	Renewal study	ADRIA	ISO 16140-2 (2016)

## 2 METHODS DESCRIPTION

---

### 2.1 Alternative method

#### 2.1.1 Principle

The 3M™ Petrifilm™ *Enterobacteriaceae* Count (EB) Plate is a sample-ready-culture medium system which contains modified Violet Red Bile Glucose (VRBG) nutrients, a cold-water soluble gelling agent, and a tetrazolium indicator that facilitates colony enumeration. 3M Petrifilm EB Plates are used for the enumeration of *Enterobacteriaceae* in the food and beverage industries. *Enterobacteriaceae* are oxidase-negative, Gram-negative rods that ferment glucose to produce acid and/or gas. On 3M Petrifilm EB Plates, *Enterobacteriaceae* will appear as red colonies with yellow zones, red colonies with gas bubbles, or red colonies with yellow zones and gas bubbles.

## 2.1.2 *Protocol*

The flow diagram is provided in **Appendix 1**.

### **2.1.3 *Restrictions***

There is no restriction.

## 2.2 Reference methods

The reference method used for the renewal study is the NF ISO 21528-2 (June 2017) - Microbiology of food and animal feeding stuffs - Horizontal methods for the detection and enumeration of *Enterobacteriaceae* - Part 2: colony-count method.

The flow diagram is provided in **Appendix 2**.

The reference method allows an incubation at 30°C or 37°C; only the incubation at 37°C was tested in this study.

### **2.3 Protocol applied during the initial validation and the renewal study**

The minimum incubation time was applied during the validation studies: 22 h at 37°C ±1°C.

♦ Analysis performed according to the COFRAC accreditation  
ADRIA Développement 5/55

**Summary report (Version 0)**

3M Petrifilm *Enterobacteriaceae* (3M 01/06 - 09/97)

### 3 INITIAL VALIDATION STUDY AND EXTENSION / RENEWAL STUDIES: RESULTS

---

*The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.*

*For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.*

#### 3.1 Method comparison study

**The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.**

##### 3.1.1 Relative trueness study

*The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical sample.*

###### 3.1.1.1 Number and nature of the samples

Seven categories were tested. The repartition per tested category and type is provided in Table 1.

**Table 1 – Categories and types**

Category		Type		Number of analyzed samples	Number of interpretable results
1	Meat products	a	Poultry meat raw and cooked	7	7
		b	Pork , beef, veal raw and cooked	7	7
		c	Delicatessen	15	15
			Total	29	29
2	Dairy products	a	Milk and cream	5	5
		b	Cheeses	16	16
		c	Dairy desserts, milk powders	10	10
			Total	31	31
3	Seafood	a	Raw	10	6
		b	Cooked	5	5
		c	Ready to eat or to reheat	6	6
			Total	21	17
4	Vegetables	a	Fresh and frozen raw products	9	9
		b	Fresh and frozen seasoned raw products	5	5
		c	Cooked vegetables	5	5
			Total	19	19
5	Miscellaneous and egg-based products	a	Composite food	5	5
		b	Pastries, chocolate	5	5
		c	Egg based products	6	6
			Total	16	16
6	Feed stuff	a	Fresh product	6	6
		b	Cooked or dehydrated product	5	5
		c	Raw materials	9	5
			Total	20	16
7	Production environmental samples	a	Surfaces	18	6
		b	Process water	10	5
		c	Dusts	7	5
			Total	35	16
ALL CATEGORIES				171	144

171 samples were analyzed, leading to 144 exploitable results by both methods.

### 3.1.1.2 Artificial and natural contamination of the samples

Artificial contaminations were realized by spiking or seeding protocols. The inoculated strains, the contamination protocols, the injured protocols of the inoculated cells and the injury evaluation are provided in **Appendix 3**. Injury efficiency was evaluated by enumerating the pure culture on selective and non-selective agars. The observed injury measurements vary from 0.4 to more than 3.40 log CFU/ml difference.

107 samples were naturally contaminated representing 74.3% of the samples, and 49 samples were artificially contaminated; 37 gave interpretable results.

### 3.1.1.3 Raw data

The raw data are provided in **Appendix 4**.

The samples were analyzed by the reference and the alternative methods in order to have 15 interpretable results per incubation protocol, and 5 interpretable results per tested type.

The data are classified in three categories (See Table 2):

- Interpretable results with the reference and the alternative methods;
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with “\*” in the data) in order to have a more precise result. These results are not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1  $\log_{10}$  units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amended by adding 1 log unit. These results are not included in the calculations but also appear on the graphs.

**Table 2 - Classification of the data**

Category		Number of samples analyzed	Number of samples with < 4 CFU/plate	Number of samples below or above the detection limit	Number of samples with interpretable results
1	Meat products	29	0	0	29
2	Dairy products	31	0	0	31
3	Seafood	21	0	4	17
4	Vegetables	19	0	0	19
5	Miscellaneous and egg-based products	16	0	0	16
6	Feed stuff	20	0	4	16
7	Production environmental samples	35	2	17	16
<b>TOTAL</b>		<b>171</b>	<b>2</b>	<b>25</b>	<b>144</b>

The samples, which were not used in the calculations, are provided in Table 3.

**Table 3 - Samples which were not used in the calculations**

Sample number	Product (French name)	Reference method: ISO 21528-2*	Alternative method : 3M Petrifilm <i>Enterobacteriaceae</i>	Category	type
154	Raw material	<4,27	5,47	6	c

6885	Cod fillet	<1,00	<1,00	3	a

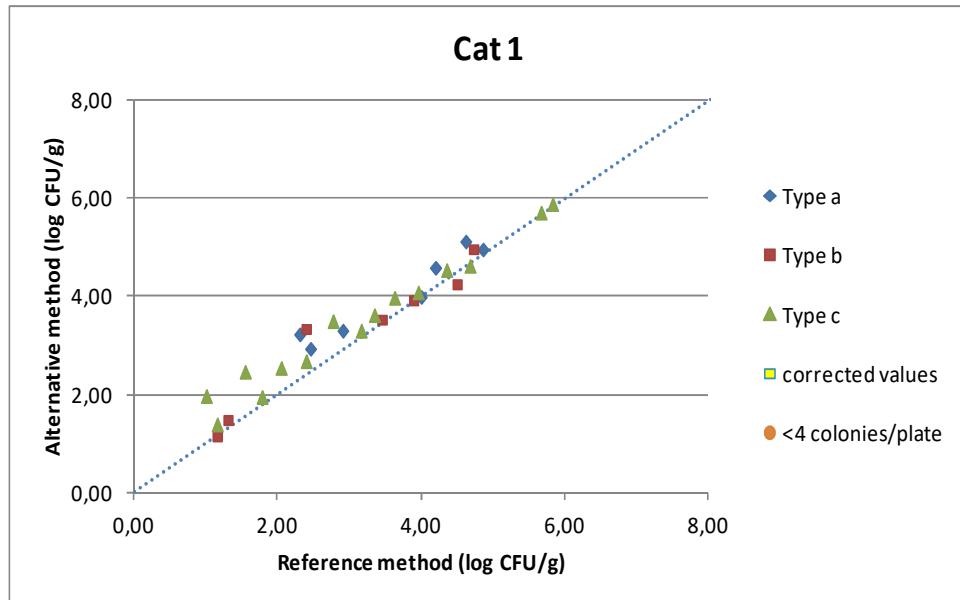

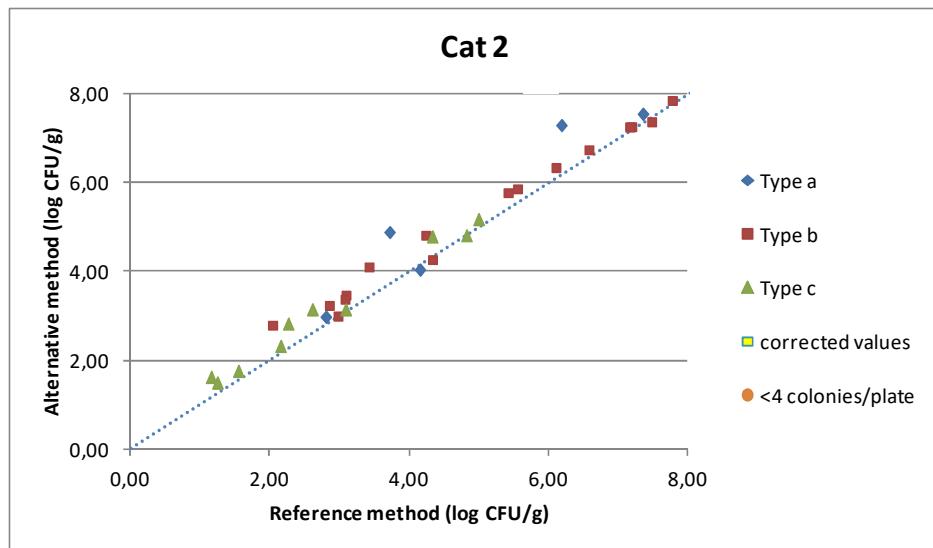

### 3.1.1.4 Statistical interpretation

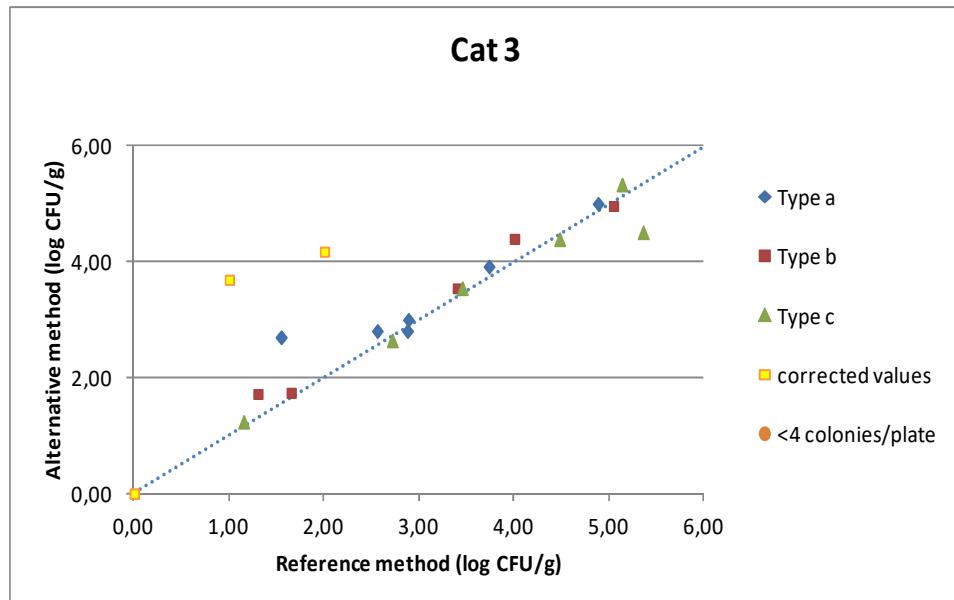

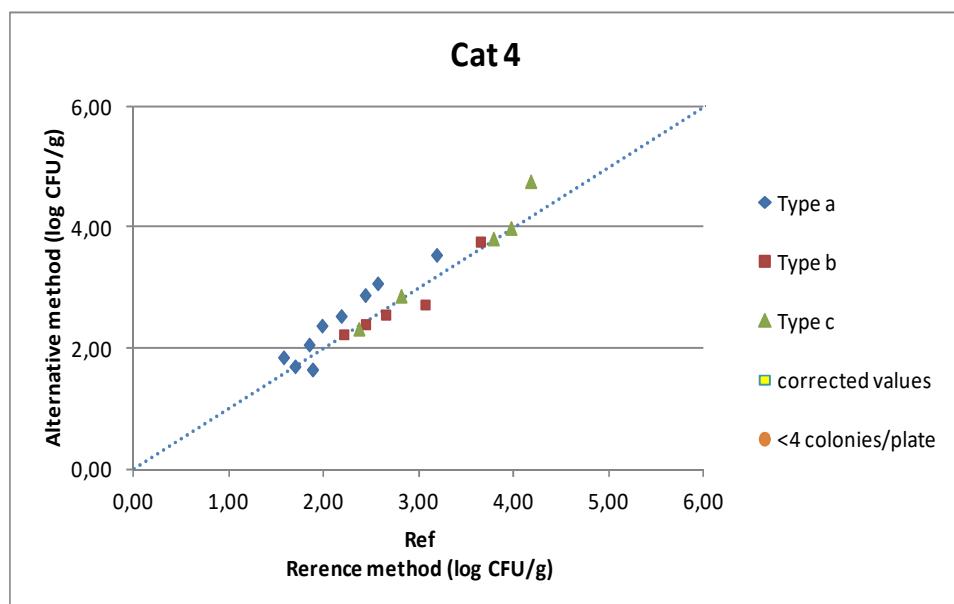

The calculations are provided in **Appendix 5**.

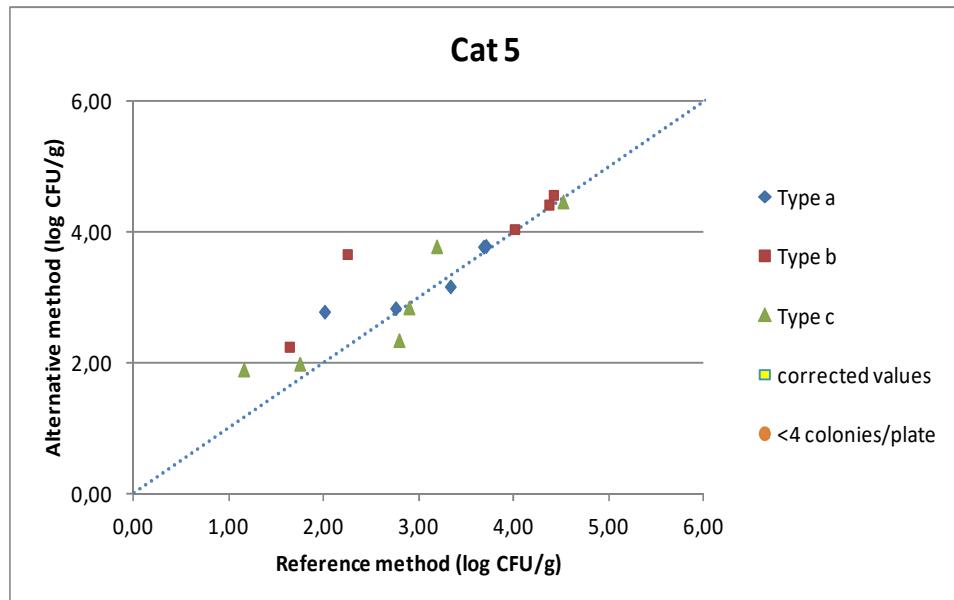

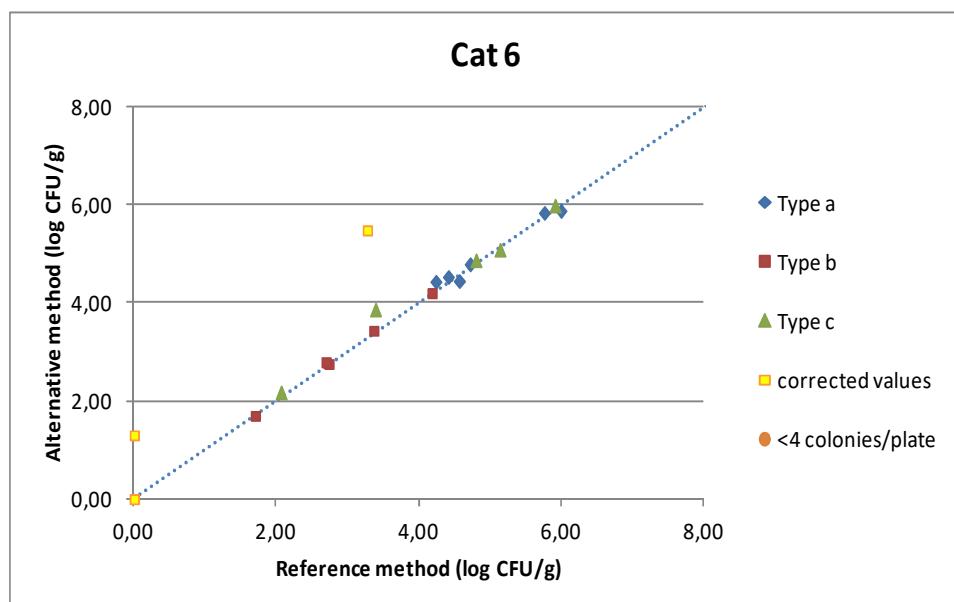

The obtained data were analyzed using the scatter plot. The graphs are provided with the line of identity ( $y = x$ ).

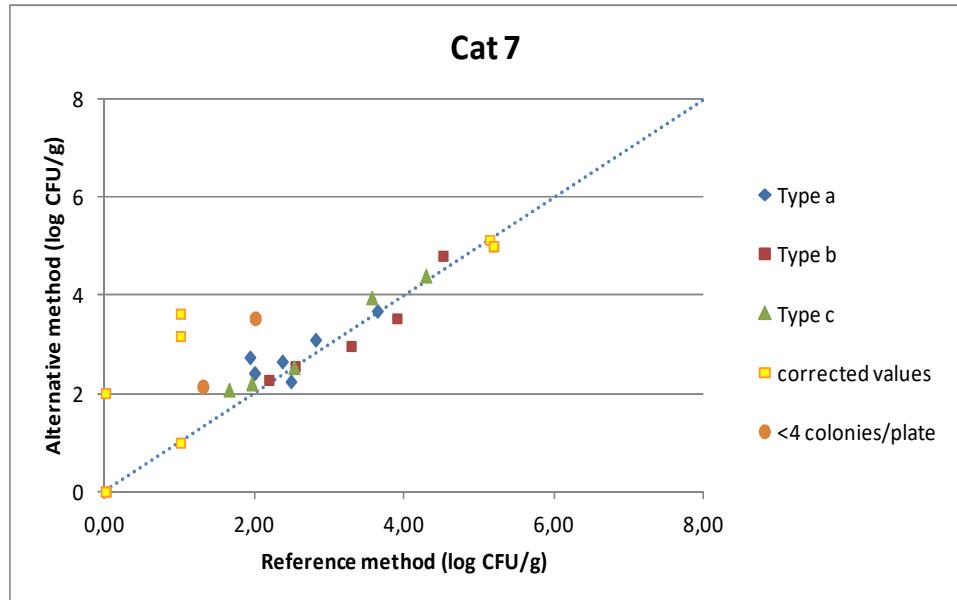

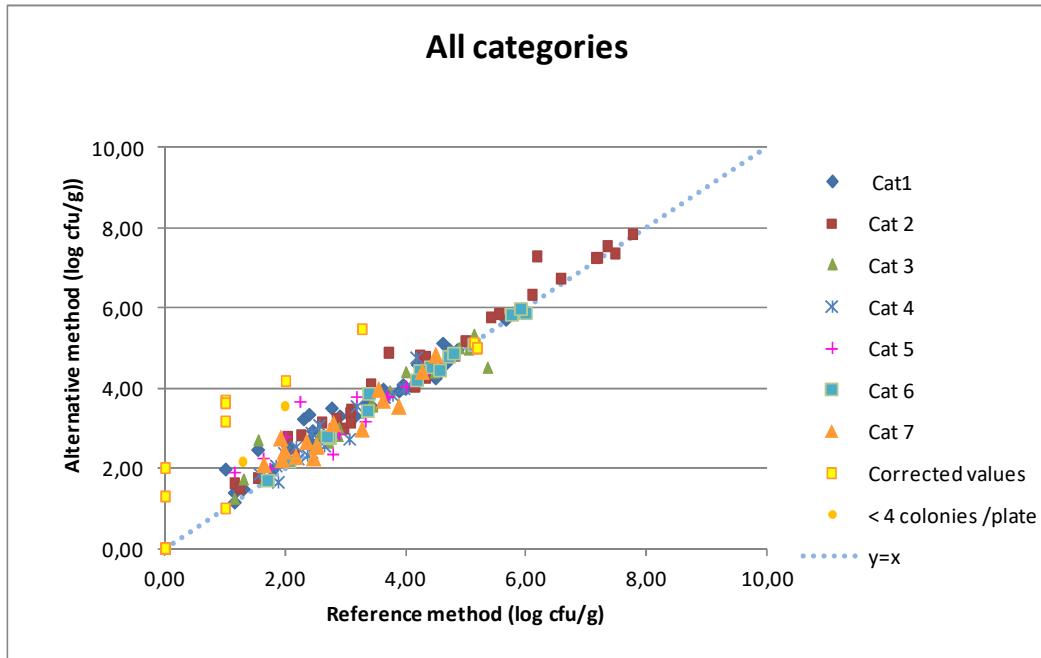

The Figures 1 to 7 show the data plotted for the different studied categories, and the Figure 8 for all the products.

\* Analyses performed according to the COFRAC accreditation

**Figure 1 - Data plotted for the Meat products****Figure 2- Data plotted for Dairy products**

**Figure 3- Data plotted for Seafood****Figure 4- Data plotted for Vegetables**

**Figure 5- Data plotted for Miscellaneous and egg-based products****Figure 6- Data plotted for Feed stuff**

**Figure 7- Data plotted for Production environmental samples****Figure 8 - Data plotted for all the products**

The calculated values for Average difference and Standard deviation differences per category are provided in Table 4.

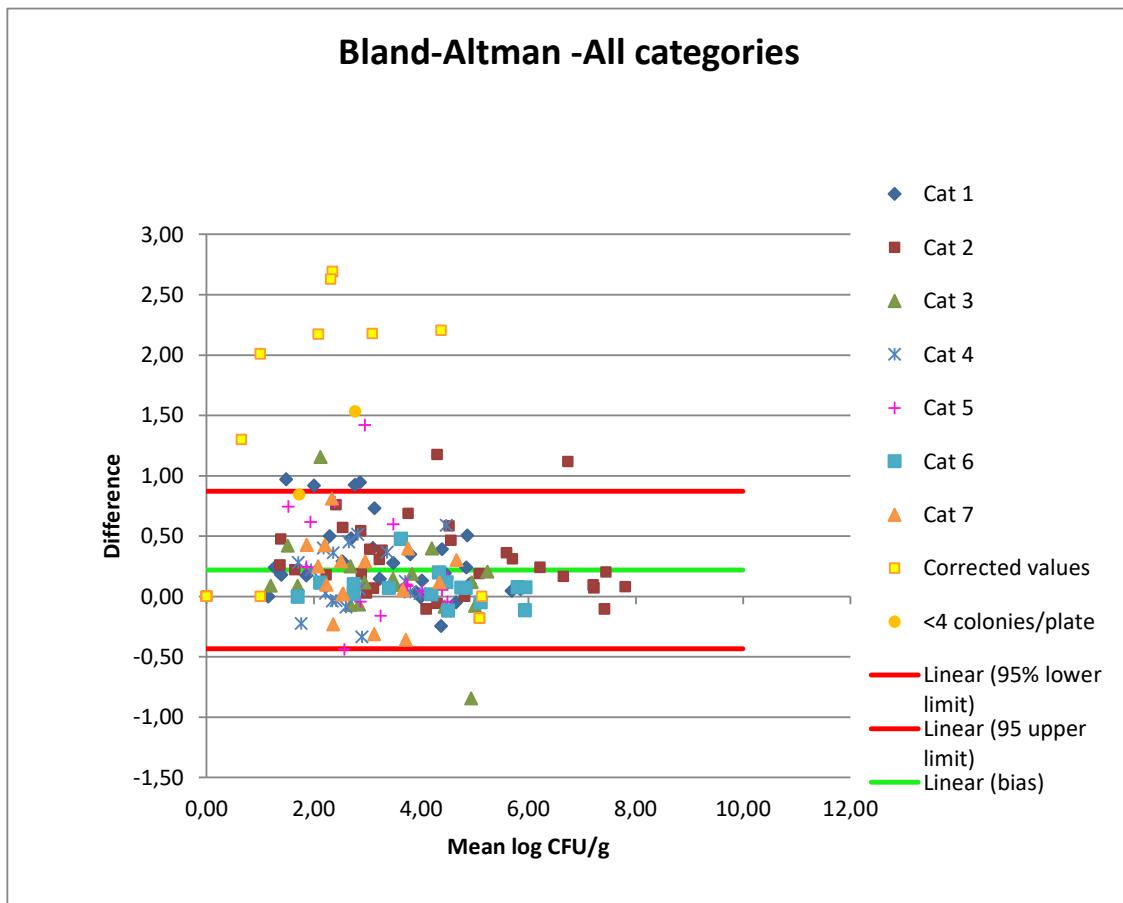

**Table 4 - Calculated values**

Category		n	$\bar{D}$	SD	Linear bias	95% lower limit	95% upper limit
1	Meat products	29	0,31	0,32	0,31	-0,36	0,99
2	Dairy products	31	0,32	0,31	0,32	-0,33	0,96
3	Seafood products	17	0,12	0,38	0,12	-0,69	0,94
4	Vegetables	19	0,14	0,25	0,14	-0,40	0,69
5	Miscellaneous and egg-based products	16	0,26	0,46	0,46	-0,55	1,46
6	Feed stuff	16	0,07	0,14	0,07	-0,23	0,37
7	Production environmental samples	16	0,16	0,30	0,16	-0,51	0,83
All categories		144	0,22	0,33	0,22	-0,43	0,87

 $\bar{D}$ : Average difference

SD: Standard deviation of differences

The Bland-Altman difference plot for all the samples is given Figure 9.

**Figure 9 – Bland-Altman difference plot for all the samples**

The average difference observed varies from 0.07 log to 0.32 log.

Samples for which the difference between the result observed with the reference and the alternative methods is above or lower than the limits are listed in Table 5.

When the difference observed between the reference and the alternative methods were above or lower than the 95 % confidence limit of agreement, the tests described in the reference method were applied on the colonies enumerated on the Petrifilm tests. The information concerning the identification and/or confirmation, is provided in Table 5.

**Table 5 - Disagreements observed between the reference and the alternative method**

Values in green: differences in favor of the alternative method

Values in black: equivalent enumeration observed with both methods

<span style="background-color: yellow; border: 1px solid black; padding: 2px;"></span>	Corrected value
<span style="background-color: orange; border: 1px solid black; padding: 2px;"></span>	Results calculated using enumeration lower than 4 CFU/plate

Category

### 3.1.1.5 Discordant results

The samples are classified in three categories (See Table 6).

**Table 6 - Classification of the samples**

		Number of samples
		24 h
Interpretable results by both methods	< LCL	1
	> UCL	8
	Total	9
<4 CFU/plate	< LCL	0
	> UCL	1
	Total	1
< or > the quantification limit	< LCL	0
	> UCL	7
	Total	7
Total < LCL		1
Total >UCL		16

For 10 samples, the difference is clearly in favor of the alternative method (confirmatory tests positive or inoculated samples). The best performances of the alternative method could be due to the fact that 3M™ Petrifilm™ *Enterobacteriaceae* Count (EB) uses a cold-water soluble gelling agent while the ISO 21528-2 method uses a melted media maintained at 44-47°C before pouring in the plates, which can have an injury effect on some *Enterobacteria* strains.

For 3 samples (6160, 6161 and 122), the enumeration obtained with the alternative method is higher than the enumeration obtained with the ISO method but the enumerated colonies were not confirmed as *Enterobacteria* using the tests described in the reference method.

For 2 samples (154 and 4009), no test was applied on the colonies enumerated on Petrifilm; it is thus impossible to know if the enumerated colonies were really *Enterobacteria*.

For one sample (144), the enumeration was slightly higher with the reference method.

For one sample (441), the enumerations were similar with both methods (Ref.: < 1.00; Alt.: 1.30).

### 3.1.1.6 Conclusion

**The relative trueness study of the alternative method is satisfying. The 3M™ Petrifilm™ Enterobacteriaceae Count Plate method is reliable when compared to the ISO 21528-2 method.**

### 3.1.2 Accuracy profile study

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and  $\beta$ -expectation tolerance intervals, both reported to different levels of the reference value.

#### 3.1.2.1 Matrices

Seven matrix/strain pairs were tested. A minimum of one type per category and two different batches were selected, using six samples per type. Two samples were contaminated at a low level, two at intermediate level, and two at a high level. For each sample, five replicates (five different test portions) were tested. In the end, thirty samples were tested per matrix type.

The tested categories, types, matrix and inoculated strains are provided in Table 7.

**Table 7 - Categories, types and matrices**

Category		Type	Matrix	Inoculated strain	Origin	Inoculation level (CFU/g)
1	<b>Meat products</b>	b: Pork, beef, veal raw and cooked	Pork pâté	<i>Enterobacter agglomerans</i> 135	Pork liver	300 10 000 100 000
2	<b>Dairy products</b>	a: Milk and cream	Pasteurized milk	<i>Hafnia alvei</i> 130	Raw milk	
3	<b>Seafood</b>	c: Raw	Salmon fillet	<i>Klebsiella oxytoca</i> 179	RTE	
4	<b>Vegetables</b>	a: Fresh and frozen raw products	Green beans	<i>Escherichia hermani</i> Ad1457	Spinach	
5	<b>Miscellaneous and egg-based products</b>	c: Egg based products	Whole liquid egg	<i>Serratia liquefaciens</i> 26	Egg product	
6	<b>Feed stuff</b>	b: Cooked or dehydrated products	Pâté for cat	<i>Citrobacter braakii</i> Ad833	Beef meat	
7	<b>Production environmental samples</b>	b: Process water (Batch 1: zucchini and split peas Batch 2: pilchards)	Process water	<i>Escherichia coli</i> 93	Dish	

### 3.1.2.2 Calculation and interpretation

The raw data are provided in **Appendix 6**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 7**. The statistical results and the accuracy profiles are provided Figure 12.

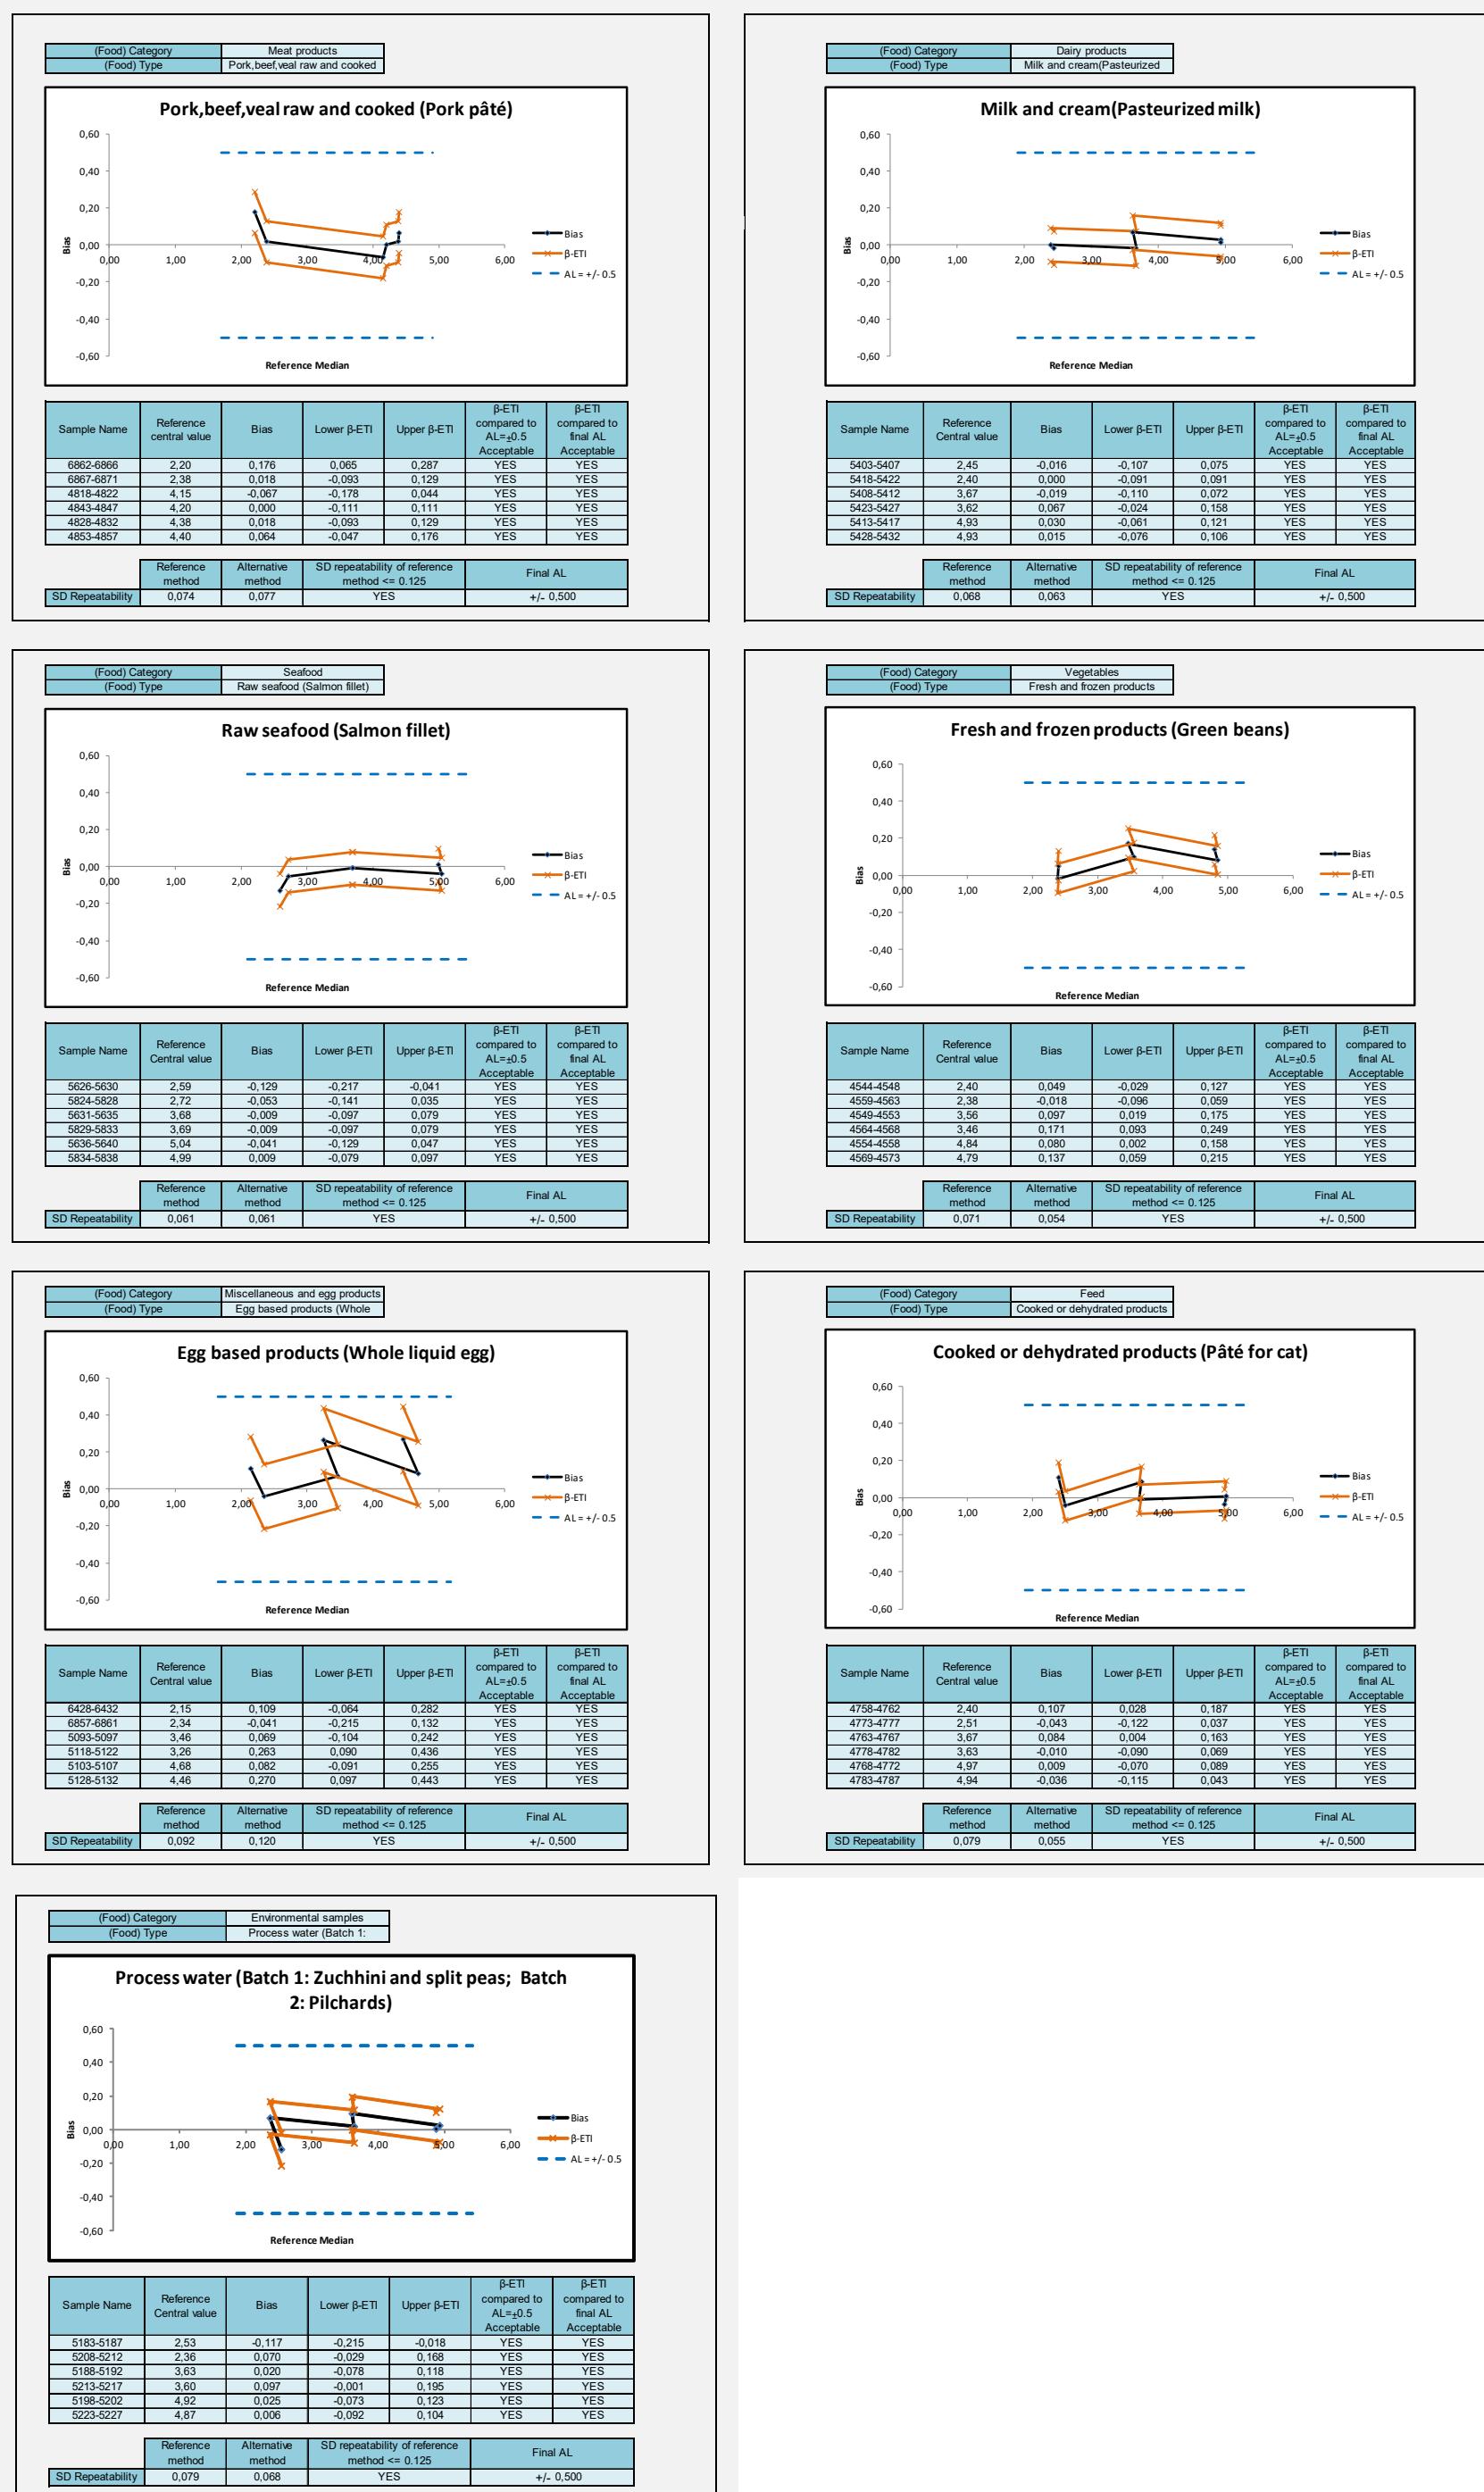

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 31-07-2018 available on <http://standards.iso.org/iso/16140>

The lower and upper  $\beta$ .ETI are within the acceptability limits for all the matrix/strain pairs tested. The acceptability limits are fixed at + 0.5 log and - 0.5 log for all the matrices tested.

### 3.1.2.3 Conclusion

**The observed profiles are comprised within the AL. All the accuracy profiles fulfill the performance criteria.**

Figure 10 – Accuracy profile

### 3.1.3 Inclusivity and exclusivity studies

The inclusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

#### 3.1.3.1 Protocol

##### Inclusivity

23 target strains were tested for the initial validation study. The study was completed by testing 27 target strains in 2017. Each test was performed once with the alternative method, the reference method and a non-selective agar. The inoculation level shall obtain a countable number on the plate.

##### Exclusivity

13 non-target strains were tested for the initial validation study. The study was completed by testing 17 strains in 2017. The pure culture was grown in a suitable non-selective broth under optimal growth conditions for at least 24 h and diluted at an appropriate level before testing. Each test was performed once with the alternative method, the reference method and a non-selective agar. The inoculation level shall obtain a countable number on the plate.

#### 3.1.3.2 Results

The raw data are provided in **Appendix 8**.

##### Inclusivity

Among the 50 strains tested; one strain (*Erwinia carotovora* CIP 103762) did not grow on VRBG and 3M™ Petrifilm plates. The second *Erwinia carotovora* (CIP 8289) grew on 3M™ Petrifilm plates but did not grow on VRBG plates.

##### Exclusivity

30 strains were tested; 4 strains gave typical colonies by both methods:

- *Aeromonas hydrophila* CIP 5750,
- *Aeromonas bestiarum* CIP 7430,

- *Xanthamonas maltophilia* CIP 6077,
- *Plesiomonas shigelloïdes* Ad673.

### 3.1.3.3 Conclusion

**Similar results were observed with the reference and the alternative methods.**

**The 3M™ Petrifilm™ Enterobacteriaceae Count Plate is specific and selective.**

### 3.1.4 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria.

Criteria to be control	Communication on criteria	Expert lab checking procedure
Storage conditions	Store the unopened 3M Petrifilm pouches at frozen or refrigerated temperature less than or equal to 8°C (46°F)	Mentioned on the instruction for use
Shelf-life and modalities of utilization after first use	Store resealed pouches in a cool dry place for no longer than four weeks	Mentioned in the kit insert
Time to result	24 h ± 2 h	Mentioned in the kit insert
Common step with the reference method		Initial suspensions and dilutions

### 3.1.5 Method comparison study conclusion

**The observed data and interpretation confirm the performances of the alternative method:**

- **139 samples were tested in the relative trueness study**, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2;
- **The observed profiles are comprised within the AL actually set at ± 0.5 Log CFU/g in the EN ISO 16140-2:2016.**
- **The inclusivity and exclusivity testing shows satisfying results.**

## 3.2 Inter-Laboratory study

**The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.**

### 3.2.1 Study organization

The inter-laboratory stud was run according to the ISO 16140 (2003) in 2001 for the renewal stud. The study was run on pasteurized skimmed milk inoculated with *Escherichia coli* 94.

15 collaborators participated to the study; the results from 14 laboratories were kept for interpretation (late reception for one laboratory).

### 3.2.2 Analysis results

#### 3.2.2.1 Results obtained by the expert Lab.

The results obtained by the expert Lab. are the following (See table 8).

**Table 8 – Results obtained by the expert Lab.**

Level	Reference method		Alternative method	
	Rep 1	Rep 2	Rep 1	Rep 2
L0	< 1	< 1	< 1	< 1
L1	2.18	2.26	2.26	2.15
L2	3.18	3.30	3.23	3.20
L3	4.11	4.23	4.08	4.15

#### 3.2.2.2 Results obtained by the collaborators

Samples were sent to 15 collaborators.

A summary of the test results is given in Table 9 (CFU/ml) and Table 10 (log CFU/ml).

**Table 9 - Summary of data (CFU/ml)**

### 3.2.3 Calculations and interpretation

#### 3.2.3.1 Visual linearity checking

The figure 11 shows the data points after  $\log_{10}$  transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method. The data are distributed closely to the first bisecting lines with a slope equal to 1.

**Figure 11 - Visual linearity checking**

#### 3.2.3.2 Accuracy profile calculations

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140>. A summary of the statistical test is provided in Table 11.

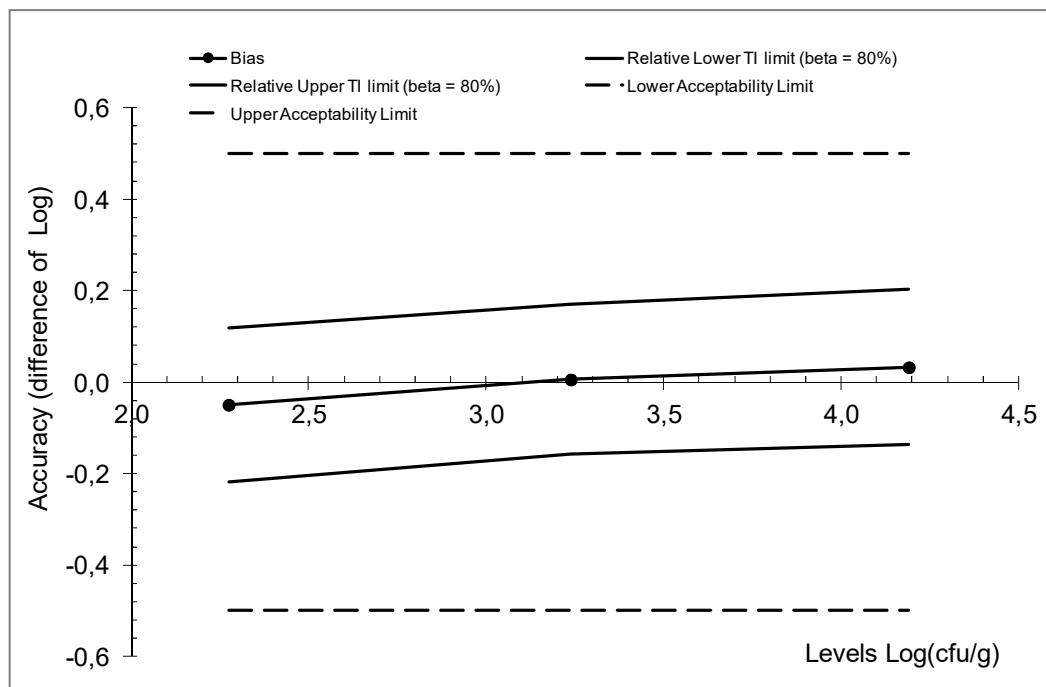

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given Figure 12

**Table 11 - Summary of statistical tests**

Accuracy profile				Alternative method			Reference method		
Study Name	3M Petrifilm Enterobacteriaceae			Low	Medium	High	Low	Medium	High
Date				80%	80%	80%	14	14	14
Coordinator				0,50	0,50	0,50	2,274	3,238	4,191
Tolerance probability (beta)				0,50	0,50	0,50	0,065	0,045	0,102

Average for alternative method	2,224	3,244	4,223						
Repeatability standard deviation (sr)	0,122	0,110	0,104						
Between-labs standard deviation (sL)	0,031	0,052	0,071						
Reproducibility standard deviation (sR)	0,126	0,122	0,126						
Corrected number of dof	26,745	25,758	23,978						
Coverage factor	1,339	1,343	1,349						
Interpolated Student t	1,314	1,315	1,318						
Tolerance interval standard deviation	0,1283	0,1245	0,1291						
Lower TI limit	2,056	3,080	4,053						
Upper TI limit	2,393	3,408	4,393						
<b>Bias</b>	<b>-0,050</b>	<b>0,006</b>	<b>0,032</b>						
<b>Relative Lower TI limit (beta = 80%)</b>	<b>-0,218</b>	<b>-0,158</b>	<b>-0,138</b>						
<b>Relative Upper TI limit (beta = 80%)</b>	<b>0,119</b>	<b>0,169</b>	<b>0,203</b>						
<b>Lower Acceptability Limit</b>	<b>-0,50</b>	<b>-0,50</b>	<b>-0,50</b>						
<b>Upper Acceptability Limit</b>	<b>0,50</b>	<b>0,50</b>	<b>0,50</b>						
<b>New acceptability limits may be based on reference method pooled variance</b>									
Pooled repro standard dev of reference		0,113							

Application of clause 6.2.3  
Step 8: If any of the values for the  $\beta$ -ETI fall outside the acceptability limits, calculate the pooled average reproducibility standard deviation of the reference method.  
Step 9: Calculate new acceptability limits as a function of this standard deviation.

FAUX

**Figure 12 - Accuracy profile**

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of  $\pm 0.5 \log$ .

**The alternative method is equivalent to the reference method.**

### 3.3 General conclusion

The **method comparison study conclusions** are:

**The observed data and interpretation confirm the performances of the alternative method:**

- 171 samples were tested in the relative trueness study providing 144 interpretable results by both the reference and the alternative method, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2;
- The observed profiles are comprised within the AL actually set at  $\pm 0.5 \log \text{CFU/g}$  in the EN ISO 16140-2:2016.
- The inclusivity and exclusivity testing shows satisfying results.

The **inter-laboratory study conclusions** are:

**The data interpretations were done according to the EN ISO 16140-2:2016.** For the three contamination levels, the alternative method is accepted as equivalent to the reference method.

**Based on the results obtained for the method comparison study and the inter-laboratory study, the 3M™ Petrifilm™ *Enterobacteriaceae* is considered equivalent to the reference method.**

Quimper, 22 September 2021
