Quality Assurance documents related to this study can be consulted upon request from **bioMérieux**.

Measurement uncertainty on the reference method results is not taken into account to provide the conclusion in this report; this measurement uncertainty is however available.

The technical protocol and the result interpretation were carried out according to the EN ISO 16140-2:2016 and the AFNOR technical rules (PR revision 7).

1 INTRODUCTION

The TEMPO® AC method was validated on the 23rd of May 2013 (Certificate number BIO 12/35-05/13) for human food, pet food and environmental samples according to the ISO 16140 (2003) standard.

The method was renewed in October 2017 and in April 2021 according to the ISO 16140-2 (2016) standard.

2 METHODS DESCRIPTION

2.1 Alternative method

2.1.1 Principle

TEMPO® system is an automated method associating an innovative card with an adapted medium to ensure rapid enumeration of several quality indicators.

The method is based on the MPN principle (Most Probably Number), with the TEMPO® card.

The TEMPO® AC test consists of a vial of culture medium and a TEMPO® card, which are specific to this test. The culture medium is inoculated with the sample to be tested and transferred by the TEMPO® Filler into the card. The microorganisms present in the card reduce the substrate in the culture medium during incubation and cause a fluorescent signal to appear, which is detected by the Tempo Reader instrument.

Depending on the number and size of the positive wells, the TEMPO® Reader calculates the number of microorganisms present in the sample according to a calculation based on the MPN method.

2.1.2 Protocol

The detailed protocol is provided in **Appendix 1**.

The different steps are the following:

- Preparation of the initial suspension according to the ISO 6887 parts in a TEMPO Stomacher bag, and decimal dilutions if necessary,
- Inoculation of the reconstituted medium
- Filling the cards using the TEMPO Filler
- Incubation of the cards for:
 - o 40 - 48 h: all foods, pet food and environmental samples (standard protocol)
 - o 24 - 28 h: raw meats including poultry, ready to eat meals, ready-to-reheat meals, fruits and vegetables, environmental samples (specific protocol)
- Reading the cards using the TEMPO Reader

It is possible to store the cards for 48 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$ before reading.

2.1.3 *Restrictions*

There is no restriction.

2.2 **Reference method[♦]**

The reference method used for comparison according to the EN ISO 16140-2:2016 is the ISO 4833-1:2013 - Microbiology of the food chain — Horizontal method for the enumeration of microorganisms — Part 1: Colony count at 30°C by the pour plate technique (See **Appendix 2**).

3 INITIAL VALIDATION STUDY AND EXTENSION/RENEWAL STUDIES: RESULTS

3.1 Method comparison study

The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.

3.1.1 *Protocols applied during the validation study*

Incubation time

For the relative trueness and the accuracy profile studies, all the samples were incubated for 40 and 48h.

For the samples concerned by both the specific and the standard protocols, three incubation times were tested (24 h, 40 h and 48 h); this was done as follows:

Two serials of TEMPO cards were inoculated:

- One serial was incubated for 24 h (samples tested with specific protocol);
- One serial was incubated for 40 h and 48 h (samples tested by both protocols).

Cards storage for 48 h at 5°C ± 3°C

For the relative trueness study, all the cards were stored for 48 h at 5°C ± 3°C after reading and read a second time. This was applied after 24 h incubation time for the samples tested with the specific protocol, and after 48h incubation time for all the samples

3.1.2 *Relative trueness study*

The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.

3.1.2.1 *Number and nature of the samples*

Seven categories were tested with three different types per category. The samples were analyzed in duplicate for the initial validation study (2013) but in triplicate for the renewal study.

During the initial validation study, 116 samples were analysed providing 41, 84 or 84 interpretable results depending on the incubation time tested (24 h, 40 h, 48 h).

For the renewal study, 55 samples were tested in 2017 providing 25, 35 or 37 interpretable results for respectively 24 h, 40 h and 48 h incubation time.

The repartition of the analysed samples and interpretable results per category, type and incubation time is provided in Table 1.

Table 1 – Categories, types and incubation times

Category	Type	Number of samples tested			Number of interpretable results		
		Incubation time			Incubation time		
		24 h	40 h	48 h	24 h	40 h	48 h
1 Raw meats including poultry	a Poultry	6	6	6	5	5	5

	Total	20	20	20	15	17	17
ALL CATEGORIES		91	171	171	66	119	121

3.1.2.2 Artificial and natural contamination of the samples

Only two samples were artificially contaminated for the renewal study (See Table 2).

Table 2 – Artificial contamination

Sample No	Product	Strain	Origin	Injury protocol	Injury measurement
1409	Pâté for cat	<i>E. coli</i> Ad1999	Poultry meat	HT 15 min at 56°C	0.4
1410	Pâté for cat	<i>E. coli</i> Ad1999	Poultry meat	HT 15 min at 56°C	0.4

3.1.2.3 Raw data

The raw data are provided in **Appendix 3**.

The samples were analysed by the reference and the alternative methods in order to have 15 interpretable results per category, and 5 interpretable results per type.

The data are classified in three categories (See Table 3):

- Interpretable results with the reference and the alternative methods;
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with “*” in the data) in order to have a more precise result. These results are not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1 \log_{10} units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amended by adding 1 log unit. These results are not included in the calculations but also appear on the graphs.

Table 3 - Classification of the data

Category		Interpretable results (combining all the incubation times)	Below the quantification limit by one or both methods	Above quantification limit by one or both methods	<4 CFU/plate
1	Ready meats including poultry	15	0	4	0
2	Ready to reheat products and delicatessen	25	4	3	3
3	Dairy products	16	7	0	0
4	Fruits and vegetables	16	3	4	0
5	Seafood products	18	3	3	1
6	Pet food	16	10	3	0
7	Environmental samples	17	5	0	0
ALL CATEGORIES		123	32	17	4

The samples, which were not used in the calculations, are provided in Table 4.

Table 4 - Samples which were not used in the calculations

*: CFU/plate < 4

N': Arithmetic average (only one dilution available for calculation).

3.1.2.4 Statistical interpretation

The calculations are provided in **Appendix 4**.

The obtained data were analysed using the scatter plot. The graphs are provided with the line of identity ($y = x$).

The Figures 1 to 7 shows the data plotted for each category.

The Figure 8 shows the data plotted for all the products.

Figure 1 - Data plotted for the Raw meats including poultry

\bar{D} : Average difference

SD: Standard deviation of differences

The average difference observed between the two methods varies from - 0.31 to - 0.09 log for 24 h incubation time, between - 0.07 to 0.09 for 40 h incubation time and between - 0.04 to 0.18 log for 48 h incubation time.

The Bland-Altman difference plot for all the samples is given:

- Figure 9 for 24 h incubation time;
- Figure 10 for 40 h incubation time;
- Figure 11 for 48 h incubation time;
- Figure 12 for 24 h incubation time + 48 h storage at 5°C ± 3°C;
- Figure 13 for 48 h incubation time + 48 h storage at 5°C ± 3°C

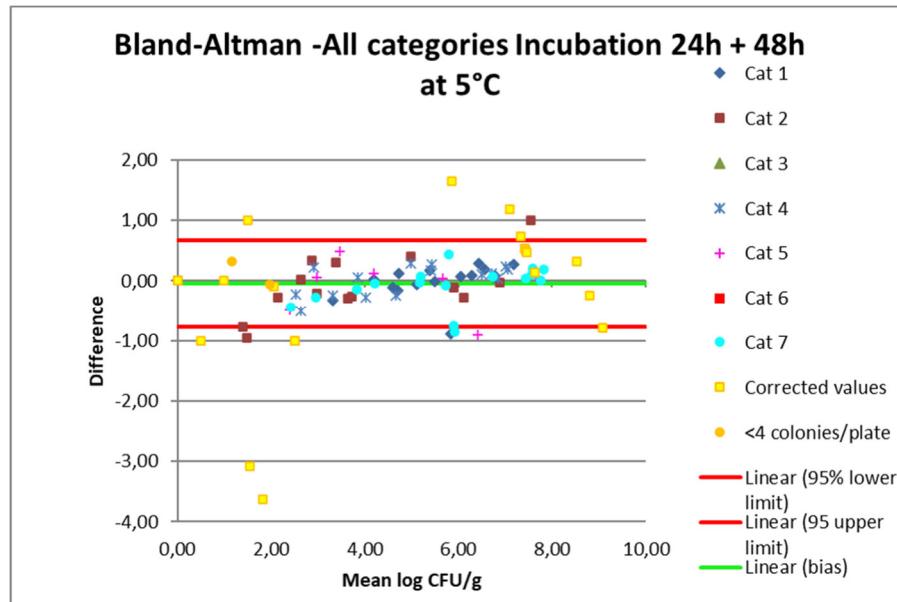

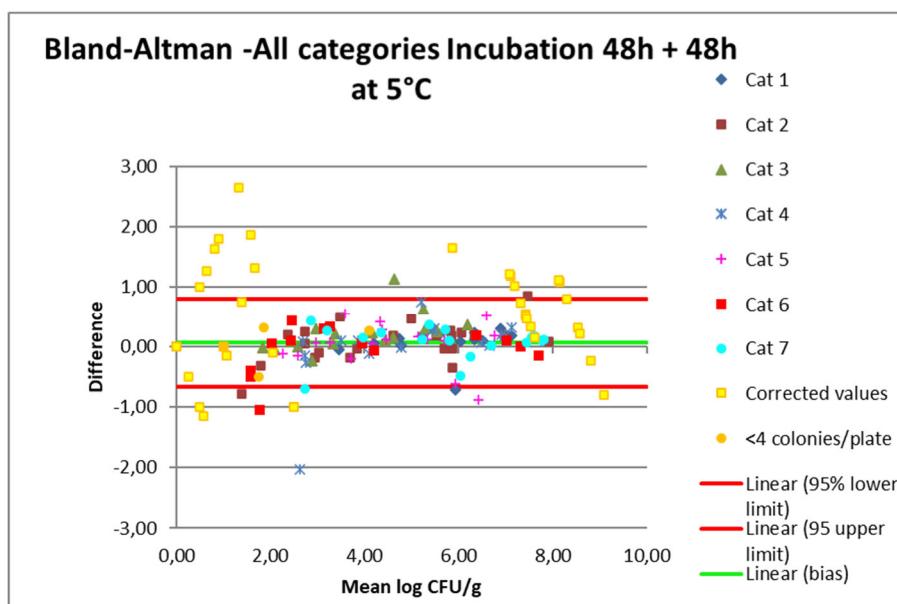

Figure 13 – Bland-Altman difference plot for all the samples
24 h incubation time + 48 h storage at 5°C ± 3°C

Samples for which the difference between the result observed with the reference and the alternative methods is above or lower than the limits are listed in Table 6.

Table 6 - Disagreements observed between the reference and the alternative methods

	Corrected value
	Results calculated using enumeration lower than 4 CFU/plate

Values in green: differences in favor of the alternative method
 Values in red: differences in favor of the reference method

Categories	
1	Raw meats including poultry
2	Ready to reheat products and delicatessen
3	Dairy products
4	Fruits and vegetables
5	Seafood products
6	Pet food
7	Environmental samples

The number of samples above and below the UCL is given for each category of data (interpretable results by both the reference and the alternative methods, less than 4 colonies per PCA plate, below or above the quantification limit by at least one of the methods) (see Table 7)

Table 7 - Number of samples above and below the UCL

		Number of samples				
		24 h	40 h	48 h	24 h + 48 h at 5°C ± 3°C	48 h + 48 h at 5°C ± 3°C
Interpretable results by both methods	< LCL	0	6	6	4	6
	> UCL	1	3	3	1	2
	Total	1	9	9	5	8
<4 CFU/plate	< LCL	0	0	1	0	0
	> UCL	0	0	0	0	1
	Total	0	0	1	0	1
< or > the quantification limit	< LCL	3	7	5	6	5
	> UCL	3	12	10	4	12
	Total	6	19	15	10	17
Total < LCL		3	13	12	10	11
Total >UCL		4	15	13	5	15
Total		7	28	25	15	26

The number of samples with difference in favour of the alternative method is equivalent to the number of samples with difference in favour of the reference method whatever the incubation times tested (24 h, 40 h and 48 h).

It is also the case when the cards were incubated for 48 h at 30°C and then stored at 5°C ± 3°C.

When the cards were incubated for 24 h at 30°C prior storage for 48 h at 5°C ± 3°C, more samples were below the 95 % confidence limit (LCL) than above the 95 % confidence limit (UCL). This was not due to an evolution of the enumerations during storage but to a modification of the LCL and UCL values before and after storage (LCL: -0.96; UCL: 0.58 before storage and LCL: -0.76; UCL: 0.60) after storage).

3.1.2.5 Conclusion

The relative trueness study of the alternative method is satisfying. Whatever the incubation times tested (24 h, 40 h and 48 h), the TEMPO AC method is reliable when compared to the ISO 4833-1 method. It is possible to store the TEMPO cards for 48 h at 5°C ± 3°C before proceeding to reading.

3.1.3 Accuracy profile study

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and β -expectation tolerance intervals, both reported to different levels of the reference value.

3.1.3.1 Matrices

Seven matrix/strain pairs were tested. A minimum of one type per category, and therefore 2 different batches, was selected, using 6 samples per type. 2 samples were contaminated at a low level, 2 at intermediate level, 2 at a high level. For each sample, 5 replicates (5 different test portions) were tested. In the end, 30 samples were tested per matrix type.

The following matrix/strain pairs were studied (See Table 8).

Table 8 - Matrix/strain pairs

Category	Matrix	Inoculated strain	Origin	Inoculation level (CFU/g)	Incubation times
1 Raw meat including poultry	Ground beef	Naturally contaminated	/	10^2 10^4 10^6	24 h 40 h 48 h
2 Ready to reheat products and delicatessen	Liver pâté	<i>Citrobacter braakii</i> Ad833	Beef meat		24 h (*) 40 h 48 h
3 Dairy products	Dairy dessert	<i>Bacillus licheniformis</i> Ad880	Milk powder		40 h 48 h
4 Fruits and vegetables	Green beans	<i>Stenotrophomonas maltophilia</i> Ad720	Food product		24 h 40 h 48 h
5 Seafood products	Fish terrine	<i>Enterobacter cloacae</i> Ad230	Tuna		24 h 40 h 48 h
6 Pet food	Dog pâté	<i>Staphylococcus aureus</i> Ad903	Animal feed		40 h 48 h
7 Environmental samples	Rinse water	<i>Listeria innocua</i> Ad1256	Slaughterhouse environment		24 h 40 h 48 h

(*) This incubation time is not in the scope of the validation study for cooked delicatessen, but it was tested during the validation study.

3.1.3.2 Calculation and interpretation

The summary tables (in log CFU/g) and calculations are provided in **Appendix**

5. The statistical results and the accuracy profiles are provided:

- Figure 14 (24 h incubation time)
- Figure 15 (40 h incubation time)
- Figure 16 (48 h incubation time).

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 31-07-2018 available on <http://standards.iso.org/iso/16140>.

Figure 14 – Accuracy profile (24 h incubation time)

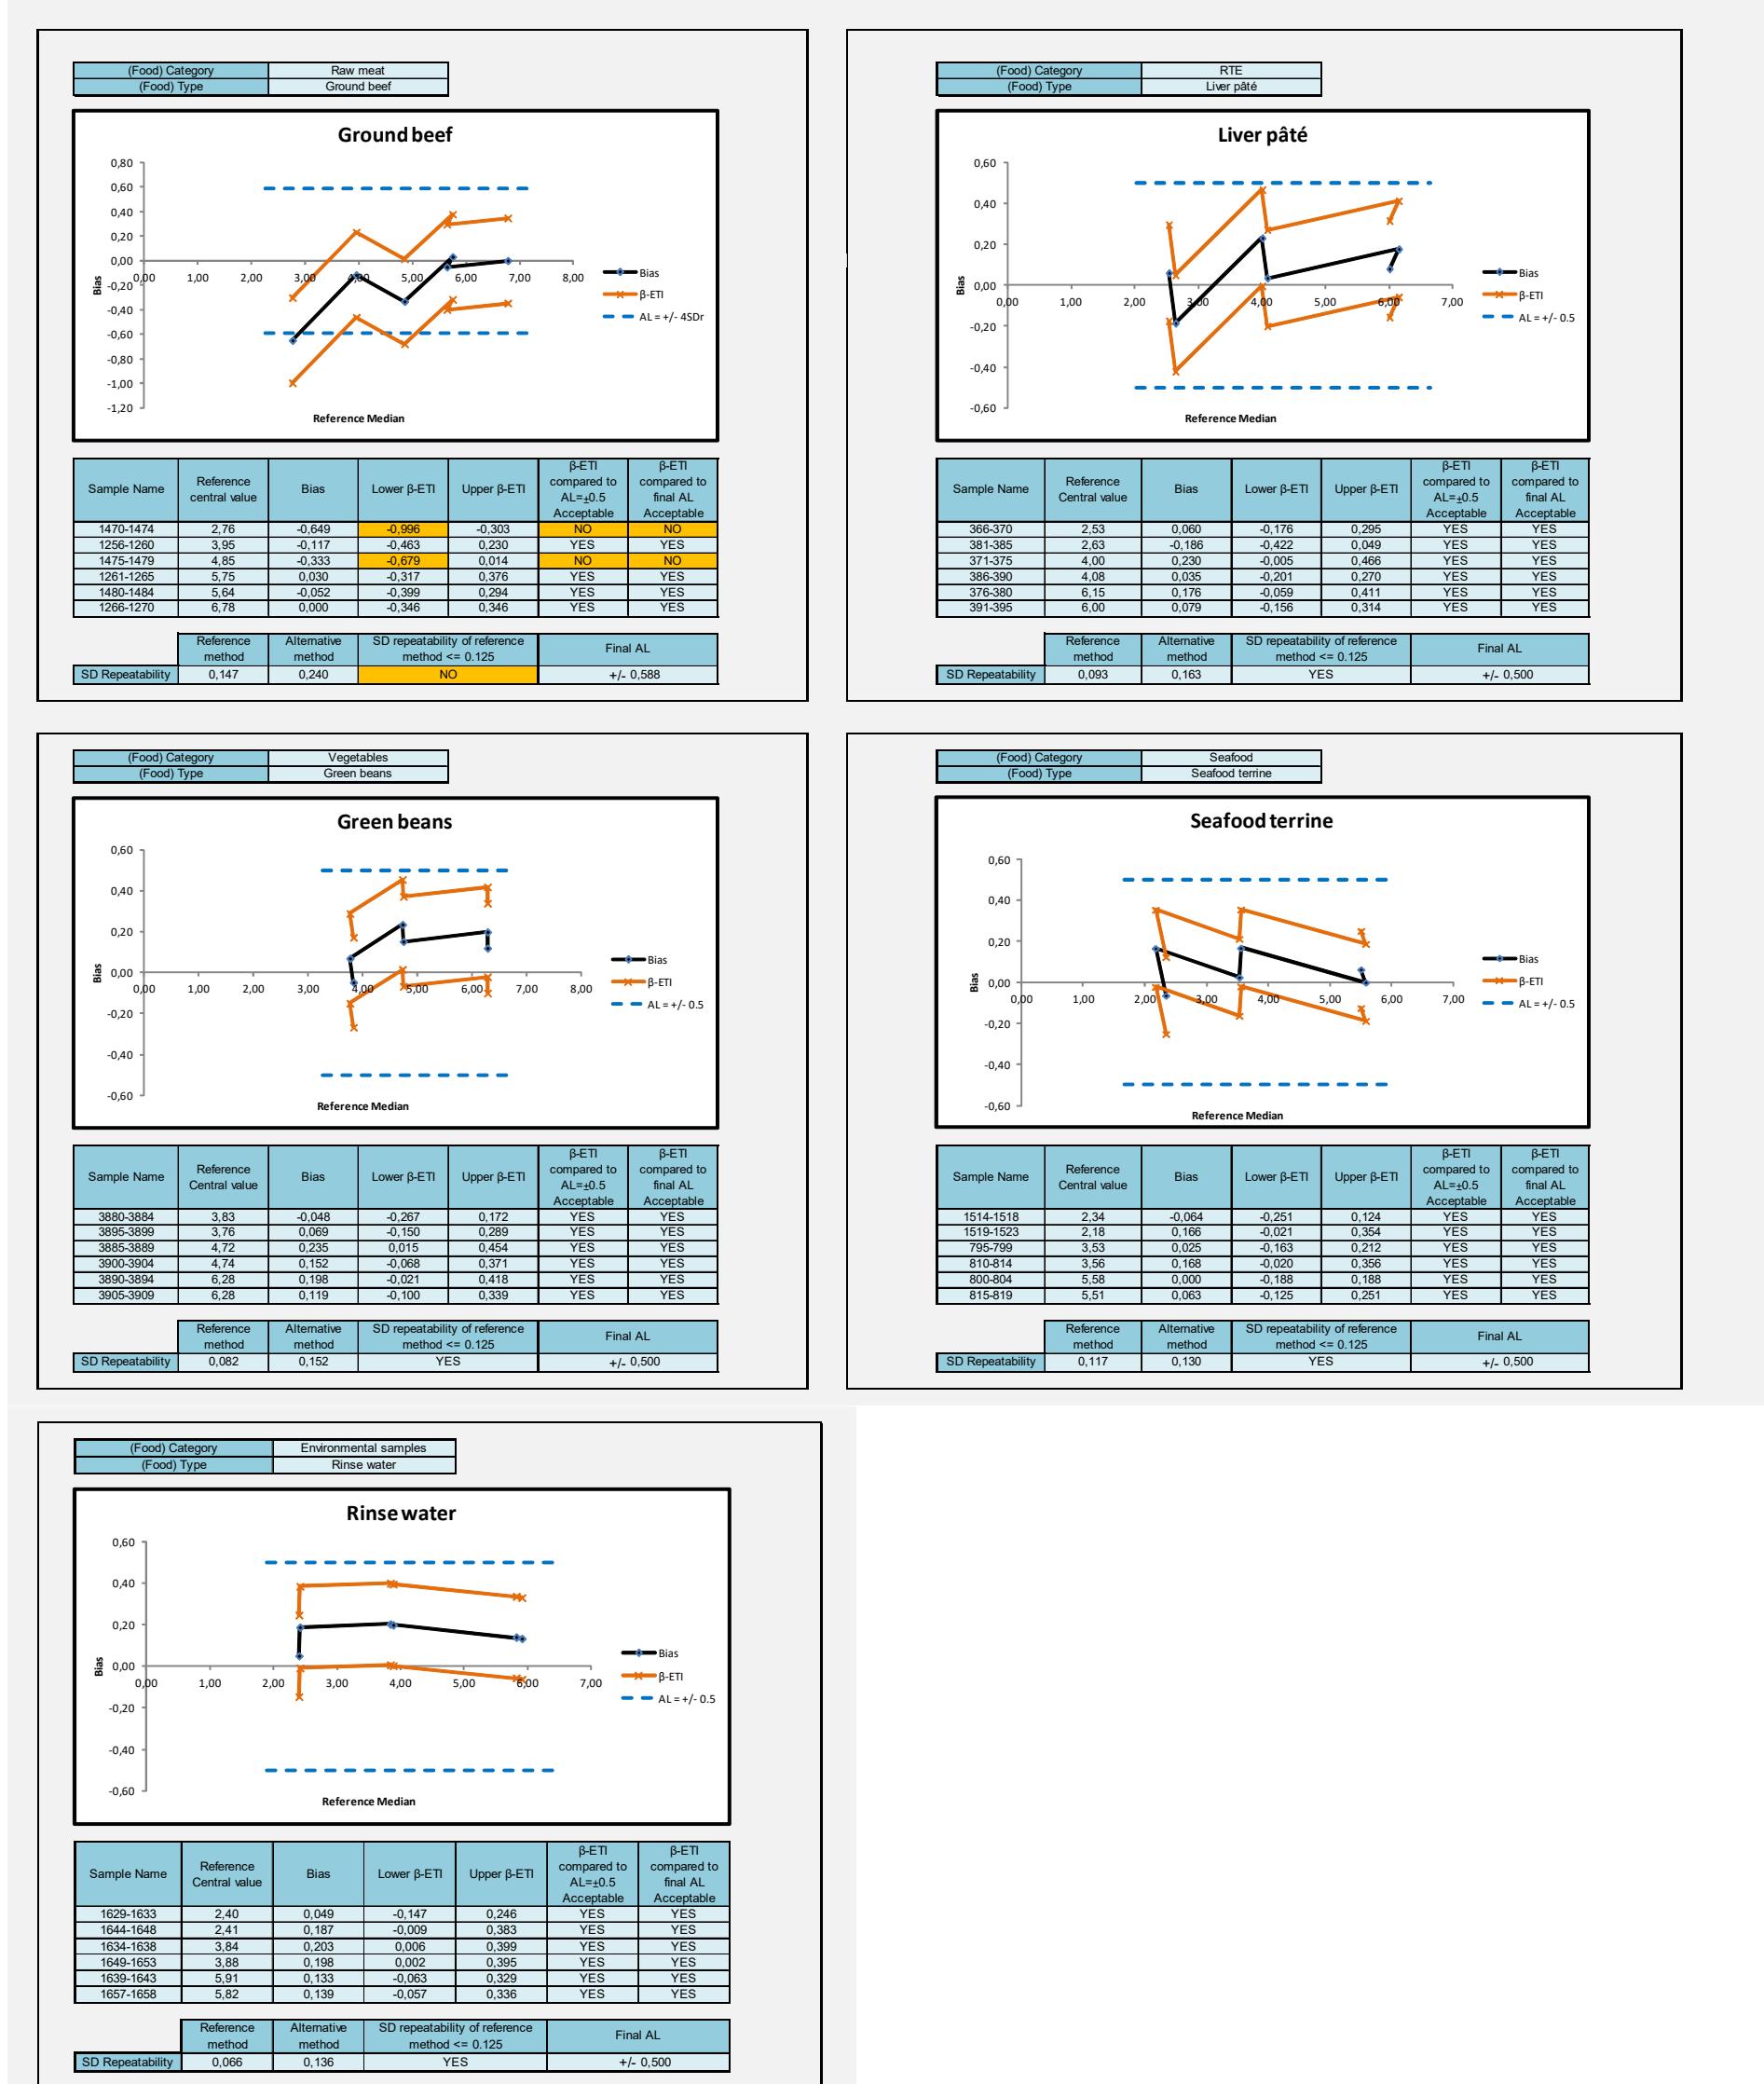

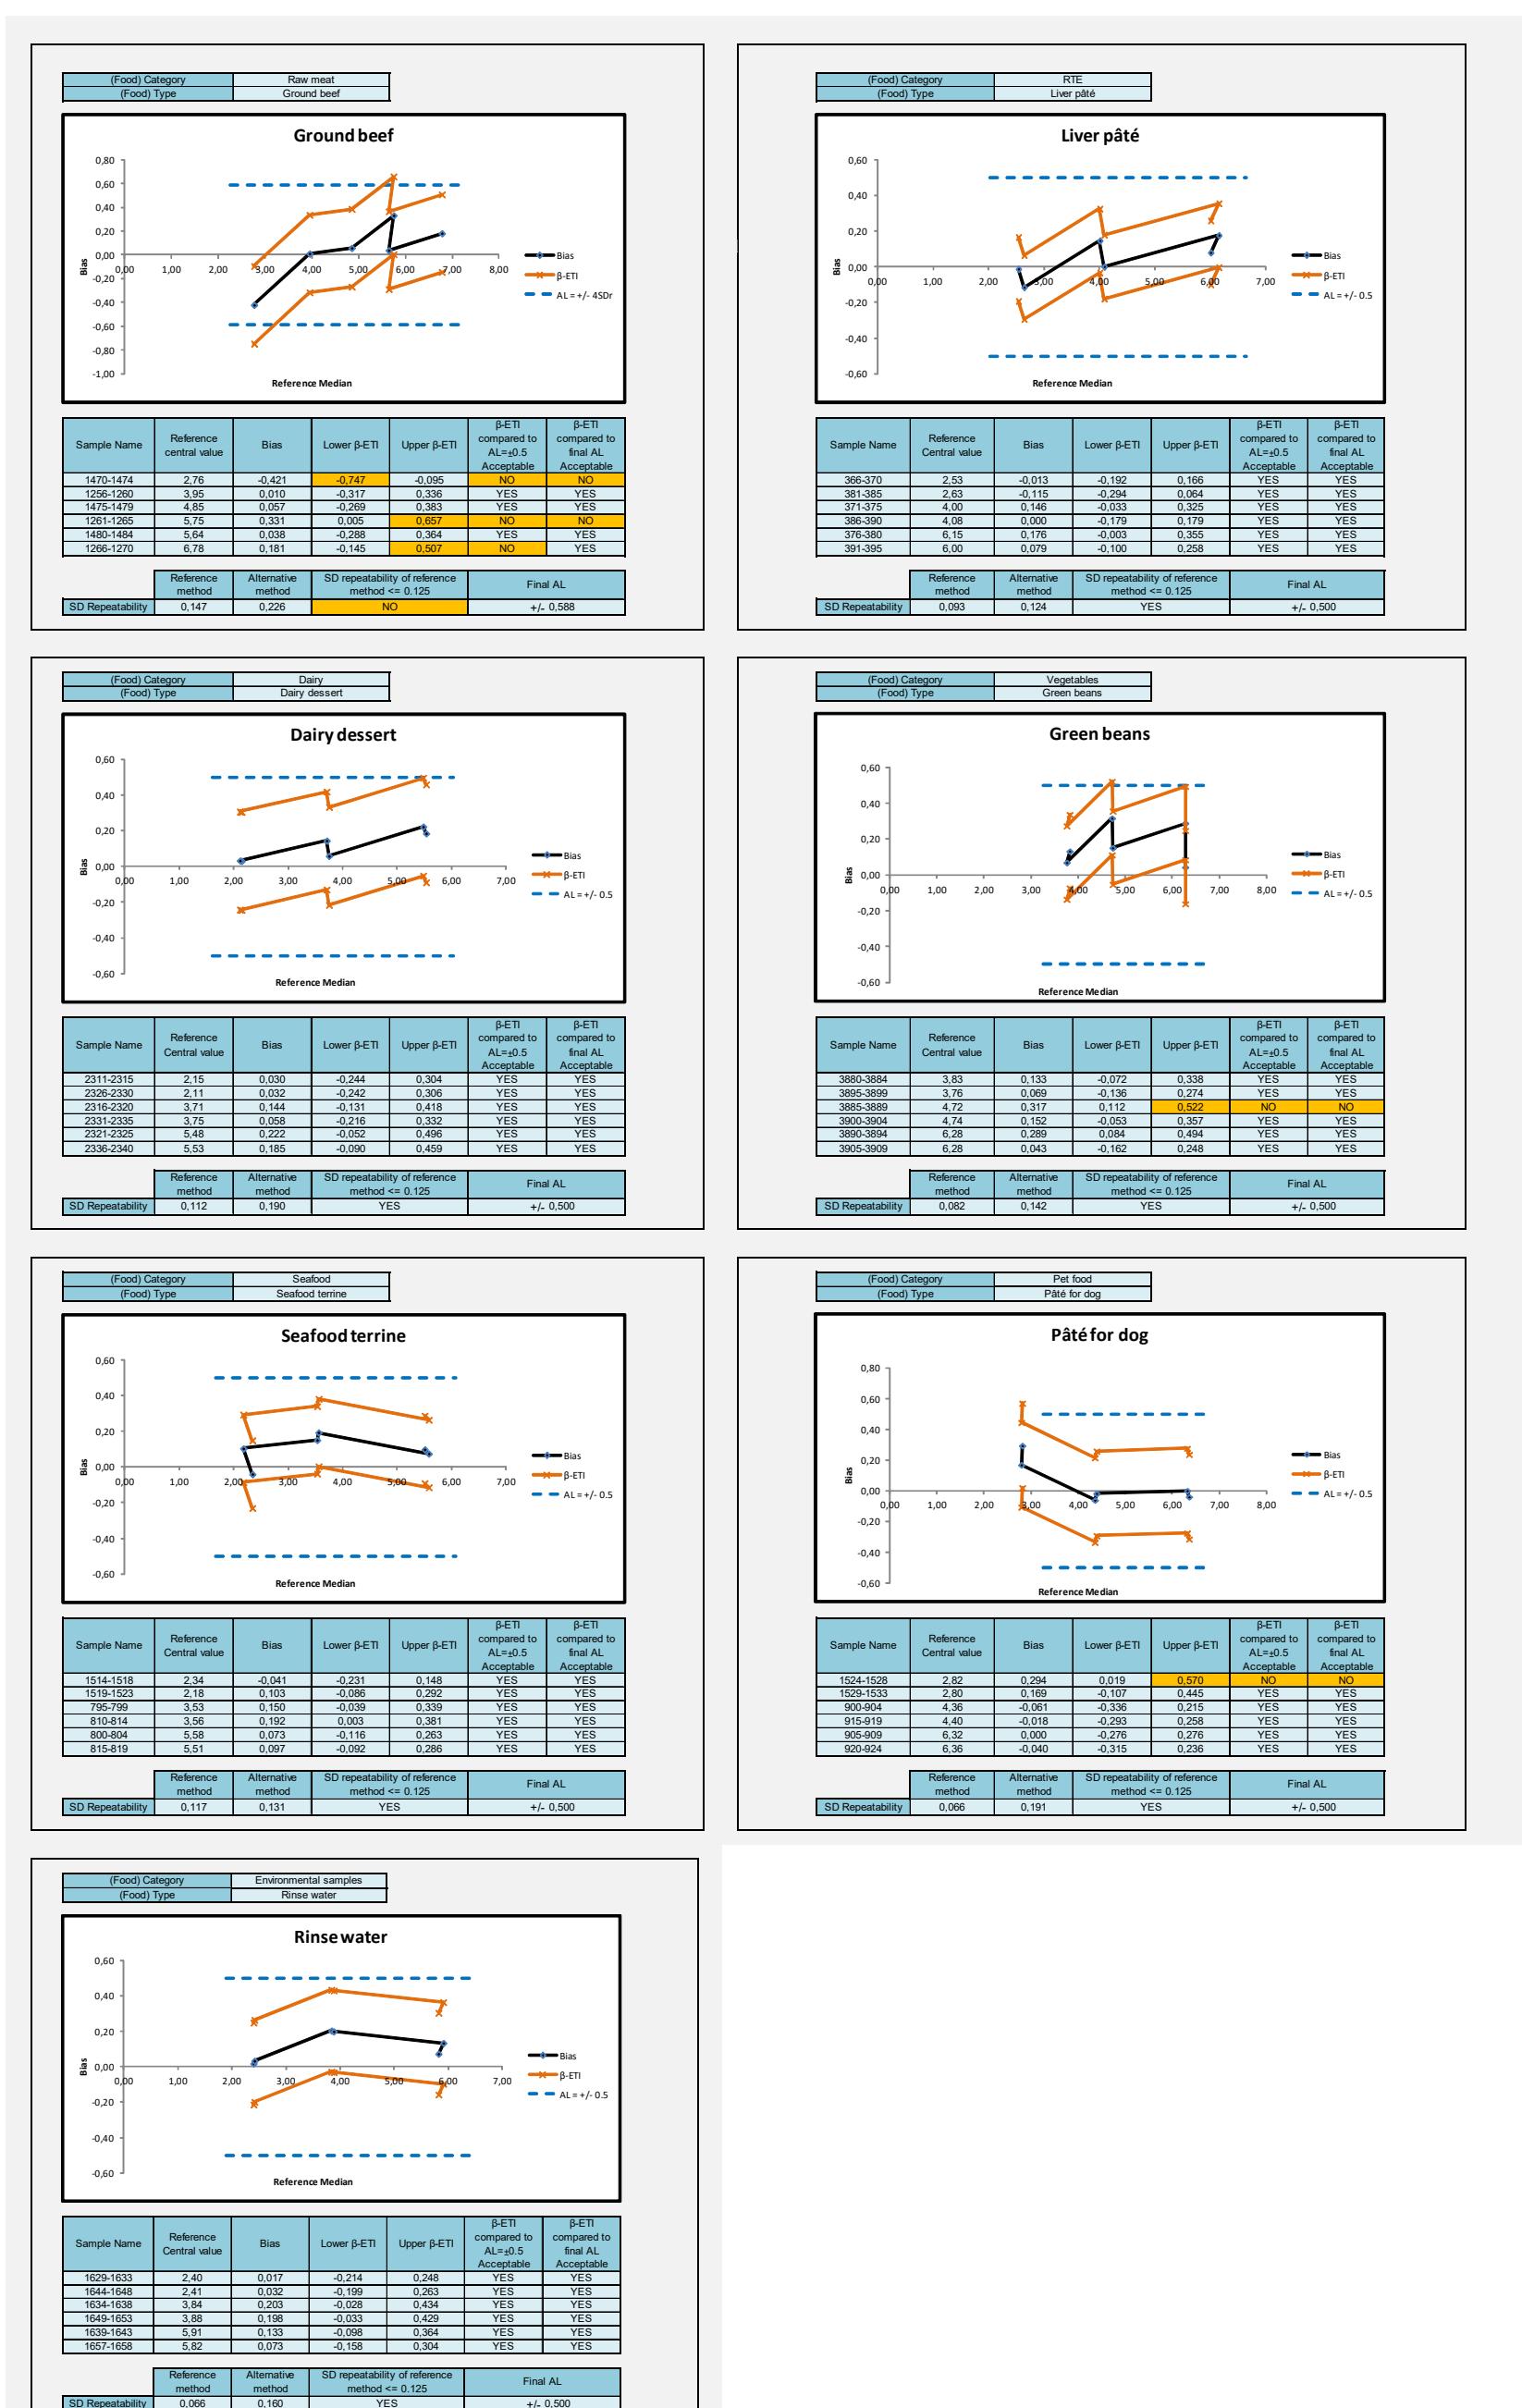

Figure 15 – Accuracy profile (40 h incubation time)

Figure 16 – Accuracy profile (48 h incubation time)

- **24 h incubation time**

The lower and upper β .ETI are within the acceptability limits for liver pâté, green beans, seafood terrine and rinse water.

For ground beef (one batch), the lower β .ETI and the bias are below the acceptability limit for the lower inoculation level (β .ETI = -0.996; bias = -0.649). The lower β .ETI (one batch) is below the acceptability limit for the intermediate inoculation level (β .ETI = -0.679).

- **40 h incubation time**

The lower and upper β .ETI are within the acceptability limits for liver pâté, dairy dessert, seafood terrine and rinse water.

For ground beef, the lower β .ETI is below the acceptability limit for the lower inoculation level for one batch (β .ETI = -0.886). The upper β .ETI is just above the acceptability limit for the medium inoculation level (β .ETI = 0.657).

The upper β .ETI is just above the acceptability limit for green beans (Upper β .ETI = 0.526) and for the pâté for dog for the low inoculation level (Upper β .ETI = 0.570) for one matrix batch.

- **48 h incubation time**

The lower and upper β .ETI are within the acceptability limits for liver pâté, dairy dessert, seafood terrine and rinse water.

For green beans, the upper β .ETI is just above the acceptability limit for the medium inoculation levels for one matrix batch (Upper β .ETI = 0.522 and 0.588).

The upper β .ETI is just above the acceptability limit for the pâté for dog for the low inoculation level (Upper β .ETI = 0.570).

3.1.3.3 Conclusion

For the matrix “Ground beef”, naturally contaminated samples were used. A ground beef batch closed to the consumption limit was mixed with a freshly prepared ground beef batch in order to cover the different contamination levels. According to the ISO 16140-2:2016, artificially contaminated samples should have been used for this part of the study. The fact that the matrix was

contaminated with many natural strains probably impacts the observed results. The liver pâté which is finally a meat product gave satisfying results at all the incubation times (24 h, 40 h, 48 h).

The observed profiles are in most of the case comprised within the Acceptability Limit (AL). Note that for ground beef, the protocol applied does not fit the protocol described in the ISO 16140-2:2016 as it is not possible to find non-contaminated sample in this category.

3.1.4 Quantification limits (LOQ)

The limit of Quantification (LOQ) is the lowest analyte concentration that can be quantified with an acceptable level of precision and trueness under the conditions of the test.

The LOQ was determined as is it needed for the instrumental methods which are related to the growth of the microorganism.

3.1.4.1 Experimental design

Blank samples were tested for each category. These blank samples were used to verify the limit of quantification of the alternative method. 10 test portions from the same sample were analysed. The same food type matrices than those tested in the accuracy profile were used.

3.1.4.2 Calculation and interpretation

The threshold standard deviation S_0 was calculated as followed:

$$s_0 = \frac{1}{n-1} \sum_{j=1}^n (y_j - \bar{y})^2$$

where:

n = the total number of test portions used

y_j = the log transformed result of test portion j

\bar{y} = the average log transformed result of all test portions

The limit of quantification is calculated as $LOQ = 10 s_0$.

3.1.4.3 Results

Raw data and calculation are provided in **Appendix 6**. The results are summarized in Table 9.

Table 9 - Quantification limits per tested matrix

Matrix	S ₀	LOQ
Beef meat	0	0
Liver pâté	0	0
Dairy dessert	0	0
Green beans	0	0
Seafood terrine	0	0
Pet food	0	0
Rinse water	0	0

3.1.5 Practicability

The TEMPO AC method practicability was evaluated according to the AFNOR criteria.

Storage conditions and shelf-life	The storage temperatures are between 2 and 25°C (room temperature before analysing) depending of the materials and reagents.		
Time to result			
Steps		Reference method	Alternative method
<i>Sampling, stomach, analysis</i>		Day 0	Day 0
<i>Reading according to the categories:</i>	<ul style="list-style-type: none"> ▪ Meat products ▪ Pet foods ▪ Dairy products ▪ Seafood products ▪ Fruits and vegetables ▪ Environmental samples ▪ Raw meats including poultry meats, salted raw meats, carcasses swabs ▪ Catering foods in meat, seafood, fruits and vegetables categories (Ready-to-eat, to re-heat or to-cook foods) ▪ All products 	Day 3	Day 1 or Day 2 depending on the tested products
Common step with the reference method	Sampling, dilution and stomach		

3.2 Inter-laboratory study

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

The results of the inter-laboratory study run in 2013 were interpreted according to the EN ISO 16140-2:2016 standard using Excel spread sheet available at <http://standards.iso.org/iso/16140> (AP Calculation tool ILS (clause 6.2.3 Calculation summary and interpretations of data) ver 14.03.2016).

3.2.1 Study organisation

16 laboratories participated to the study.

Ready-to-reheat meal (Purée with meat) was inoculated with *Escherichia coli* adria 19. Inoculation levels, which were targeted, were:

- < 10 CFU/g,
- 100 – 1 000 CFU/g,
- 1 000 – 10 000 CFU/g,
- 10 000 – 100 000 CFU/g.

3.2.2 Experimental parameters control

3.2.2.1 Strain stability

In order to evaluate the stability of the inoculated strain during transport and storage, bacterial counts of samples were checked at different times, i.e. inoculation time, after 24 h and 48 h of storage at 4°C.

Six test portions (3 contamination levels x 2 replicates) were enumerated (See Table 10).

Table 10 - Strain stability in the matrix

		ISO 4833-1 (CFU/g)		TEMPO AC (CFU/g)	
		Sample 1	Sample 2	Sample 1	Sample 2
Day 0	Level 1	560	520	480	360
	Level 2	4 700	4 200	6 800	5 000
	Level 3	45 000	50 000	110 000	78 000
Day 1	Level 1	530	650	930	540
	Level 2	5 600	5 300	6 700	7 800
	Level 3	56 000	52 000	55 000	60 000
Day 2	Level 1	660	510	450	730
	Level 2	5 500	4 500	8 100	7 100
	Level 3	42 000	48 000	82 000	68 000

No evolution of the inoculated strain was observed between Day 0 and Day 2.

3.2.2.2 Homogeneity of inoculation

This test was not run for the inter-laboratory study as it was not required in 2013 (inter-laboratory study run according to the ISO 16140:2003).

3.2.3 Analysis results

The raw data are given in **Appendix 7**.

3.2.3.1 Results obtained by the expert Lab.

The results obtained by the expert Lab. are the following (See Table 11).

Table 11 – Results obtained by the expert Lab.

Inoculation level	Reference method		Alternative method	
	Sample 1	Sample 2	Sample 1	Sample 2
0	< 10	< 10	< 10	< 10
1	660	510	450	730
2	5 500	4 500	8 100	7 100
3	42 000	48 000	82 000	68 000

Targeted contamination levels were reached.

3.2.3.2 Results obtained by the collaborators

A summary of the test results is given in Table 12 (CFU/g) and Table 13 (log CFU/g).

Table 12 - Summary of data (CFU/ml)

3.2.4 Calculations and interpretation

3.2.4.1 Visual linearity checking

The Figure 17 shows the data points after \log_{10} transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method.

The data are distributed closely to the first bisecting line.

Figure 17 - Visual linearity checking

3.2.4.2 Accuracy profile calculation

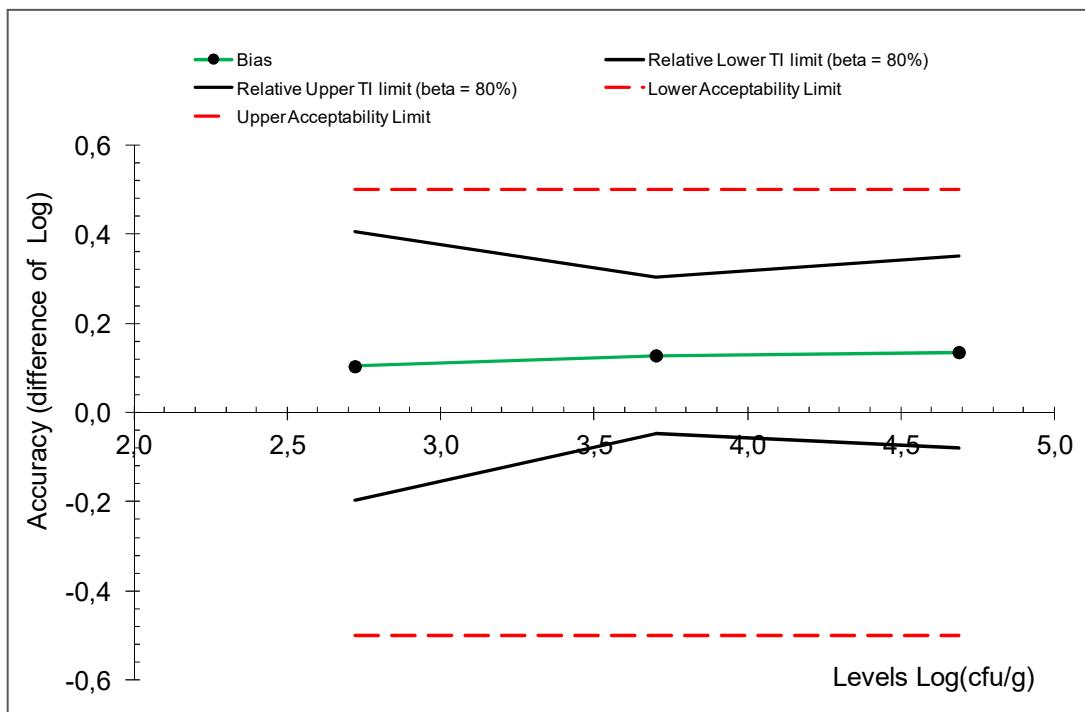

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140> (ver 14-03-2016). A summary of the statistical test is provided in Table 14; the detailed calculation is given in **Appendix 8**.

Table 14 - Summary of the statistical test

	Dataset		
	15		
	Low level	Medium level	High level
Target value	2,720	3,701	4,688
Bias	0,104	0,128	0,135
β .ETI lower (80 %)	-0,198	-0,047	-0,081
β .ETI upper (80 %)	0,405	0,303	0,352
Lower AL		-0,500	
Upper AL		0,500	

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given Figure 18.

Figure 18

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of 0.5 log.

The results obtained with the alternative method are not statistically different than those obtained with the reference method.

3.3 Conclusion

The observed data and interpretation confirm the performances of the alternative method:

- 121 samples with interpretable results were tested in the relative trueness study, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2. This study confirms the possibility as well to store the TEMPO card for 48 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$ before reading for all human food categories, pet food and environmental samples.
- The observed profiles are comprised within the AL actually set at 0.5 Log CFU/g in the EN ISO 16140-2:2016 for most of the matrix/strain pairs tested.
- The TEMPO AC method shows satisfying performances when compared to the ISO 4833-1 method.

Validation of Alternative methods
[Signature]
Food Safety & Quality

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

Appendix 1 - Flow diagram of the alternative method: TEMPO AC

Sample preparation: 1/10 in TEMPO® Stomacher bag according to ISO 6887 parts

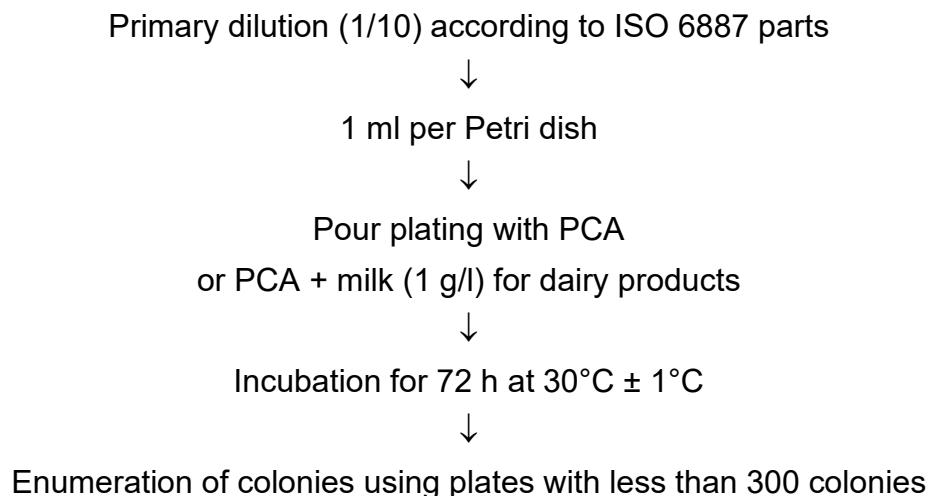

The 1/40 dilution allows 10 to 49 000 cfu/g enumeration.

The 1/400 dilution allows 100 to 490 000 cfu/g enumeration.

The 1/4000 dilution allows 1 000 to 4 900 000 cfu/g enumeration.

Appendix 8 - Inter-laboratory study: accuracy profile calculation (statistical calculations)

Accuracy profile			
Study Name	TEMPO AC		
Date	2013		
Coordinator	ADRIA		
Tolerance probability (beta)	80%	80%	80%
Acceptability limit in log (lambda)	0,50	0,50	0,50
Alternative method			
Levels	Low	Medium	High
Target value	2,720	3,701	4,688
Number of participants (K)	16	16	16
Average for alternative method	2,824	3,829	4,824
Repeatability standard deviation (sr)	0,227	0,131	0,148
Between-labs standard deviation (sL)	0,000	0,000	0,066
Reproducibility standard deviation (sR)	0,227	0,131	0,162
Corrected number of dof	30,968	30,968	29,833
Coverage factor	1,330	1,330	1,334
Interpolated Student t	1,309	1,309	1,311
Tolerance interval standard deviation	0,2301	0,1335	0,1650
Lower TI limit	2,522	3,654	4,607
Upper TI limit	3,125	4,004	5,040
Bias	0,104	0,128	0,135
Relative Lower TI limit (beta = 80%)	-0,198	-0,047	-0,081
Relative Upper TI limit (beta = 80%)	0,405	0,303	0,352
Lower Acceptability Limit	-0,50	-0,50	-0,50
Upper Acceptability Limit	0,50	0,50	0,50
New acceptability limits may be based on reference method pooled variance			
Pooled repro standard dev of reference	0,116
