

NF VALIDATION
Validation of alternative analytical methods
Application in food microbiology

Summary report

Validation study according to the EN ISO 16140-2:2016

RAPID'Salmonella method

(Certificate number: BRD 07/11 - 12/05)

**for Salmonella detection in human food, pet food and animal feed
and environmental samples (excluding samples for primary production)**

Qualitative method

> Expert Laboratory:	ADRIA Développement ZA Creac'h Gwen 29196 Quimper Cedex (France)
> For:	BIO-RAD 3 boulevard Raymond Poincaré 92430 Marnes-La-Coquette (France)

This report consists of 188 pages, including 13 appendices.

Only copies including the totality of this report are authorised.

Competencies of the laboratory are certified by COFRAC accreditation for the analyses marked with the symbol♦.

1 INTRODUCTION

The initial validation was obtained on 9th of December 2005 (Certificate number BRD 07/11 – 12/05) for all food products using the double step enrichment protocol. The different validations are listed in the table below:

Date	Validation	Reference method	Validation standard
December 2005	Initial validation for the double step enrichment protocol for a broad range of food products	ISO 6579 (2002)	ISO 16140 (2003)
July 2009	Extension for: <ul style="list-style-type: none"> - A modification in the aspect of the RAPID' <i>Salmonella</i> agar which is now opaque, - A simplification in the confirmation protocol, - A simplification in the enrichment protocol to move to a short protocol (food and pet food and animal feed) 	ISO 6579 (2002)	ISO 16140 (2003)
September 2009	Renewal study	ISO 6579 (2002)	ISO 16140 (2003)
May 2010	Extension for environmental samples using the RAPID' <i>Salmonella</i> short protocol	ISO 6579 (2002)	ISO 16140 (2003)
February 2011	Inclusivity testing on 5 <i>Salmonella</i> Dublin and 2 <i>Salmonella</i> bongori in order to check that the strains with low esterase activity are detected with the RAPID' <i>Salmonella</i> method.	/	ISO 16140 (2003)
October 2012	Extension for using new latex tests (<i>Salmonella</i> Confirm Latex test and Oxoid <i>Salmonella</i> Latex) for confirmation	/	ISO 16140 (2003)
November 2013	Renewal study	ISO 6579 (2002)	ISO 16140 (2003)
July 2015	Extension for milk powders including infant formula with and without probiotics, and related dehydrated dairy ingredients (up to 375 g test portion size).	ISO 6579 (2002)	ISO 16140 (2003)

Date	Validation	Reference method	Validation standard
March 2018	Renewal study for: <ul style="list-style-type: none"> - The double step enrichment protocol for dairy products (excluding raw milk) only. - The short protocol for all food products, feed and environmental samples. Extension for storage of RAPID' <i>Salmonella</i> plates for 72 h at 5°C ± 3°C before reading. Extension for using the Biotyper from Bruker for the confirmation of the typical colonies isolated on RAPID' <i>Salmonella</i> plates or after purification step on a non-selective agar plate.	ISO 6579-1 (2017)	ISO 16140-2 (2016)
October 2020	Extension for a new category analyzed with a new protocol: Infant formula and infant cereals with or without probiotics including ingredients (up to 375 g test portion size)	ISO 6579-1 (2017) ISO 6579-1/A1 (2020)	ISO 16140-2 (2016)
February 2023	Extension for pet food and animal feed (up to 375 g test portion size)	ISO 6579-1 (2017) ISO 6579-1/A1 (2020)	ISO 16140-2 (2016)

2 METHOD PROTOCOLS

2.1 Alternative method

The flow diagram of the alternative method is provided in **Appendix 1**.

2.1.1 Principle

RAPID' *Salmonella* agar allows the presumptive identification of *Salmonella* spp. by detecting C8-esterase activity. Simultaneous screening of β-glucosidase activity permits the differentiation of *Salmonella* colonies from those of other enterobacteria.

After incubation, *Salmonella* appears as readily identifiable typical magenta colonies whereas non-*Salmonella* grow as blue or non-coloured colonies.

RAPID' *Salmonella* agar permits detection of motile and non-motile *Salmonella*, as well as lactose-positive *Salmonella*, *Salmonella* Typhi and *Salmonella* Paratyphi.

2.1.2 Protocol

Five protocols, including the new protocol tested for this extension study, are available depending on the tested categories (See **Table 1**).

Table 1 - Protocols

Protocol	Categories	Enrichment step
1 (double step enrichment protocol)	Dairy products (<i>excluding raw milk</i>)	25 g + 225 ml BPW 16-20 h at 37°C ± 1°C Subculture in RVS broth for 6 h to 26 h at 41.5°C ± 1°C
2	All food products, pet food and animal feed Production environmental samples (25 g test portion or sample device)	25 g + 225 ml BPW + supplement 16-22 h at 41.5°C ± 1°C
3	Milk powders including infant formula (with and without probiotics), and related dehydrated dairy ingredients (375 g test portion)	375 g + 3375 ml pre-warmed BPW (double strength BPW for infant formula with probiotics) d 1/10 20-24 h at 37°C ± 1°C
4	Infant formula and infant cereals with or without probiotics including ingredients (375 g test portion)	375 g + 1125 pre-warmed BPW (37°C) + PIF supplement d 1/4 18-24 h at 37°C ± 1°C. Addition of α-amylase for infant cereals (0.1 g/L)
5	Pet food and animal feed (375 g)	375 g + 1875 ml (d 1/6) pre-warmed (37°C) BPW + RSLM Supplement for 18 - 24 h at 37.0°C ± 1°C.

After enrichment step, 10 µl of the enrichment broth is streaked onto RAPID[®] *Salmonella* agar incubated for 24 h ± 2 h at 37°C ± 1°C. The typical colonies are confirmed using one of the following protocols:

- The conventional tests described in the reference method
- Latex test on an isolated colony without purification step using the *Salmonella* latex (3556710) or *Salmonella* Confirm Latex (3556711) or *Salmonella* Latex (Thermo Fisher Scientific DR1108A)
- PCR from an isolated colony using the iQ-Check *Salmonella* method
- Oxidase, OMNI-O and ONPG tests
- The Maldi-Biotyper from Bruker.

It is possible to store the enrichment broth for 72 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$ before streaking onto RAPID' *Salmonella* plates for the short protocols (protocols 2, 3 and 4) and the plates for 72 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$ before reading.

2.1.3 Restrictions

Raw milk is excluded from the scope of the double step enrichment protocol.

2.2 Reference method♦

The reference methods correspond to:

- The ISO 6579-1 (February 2017) - Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* spp. - Part 1: detection of *Salmonella* spp.
- The ISO 6579-1/A1 (March 2020): Microbiology of the food chain - Horizontal method for the detection, enumeration and serotyping of *Salmonella* spp. - Part 1: detection of *Salmonella* spp. Amendment 1: Broader range of incubation temperatures, amendment to the status of Annex D, and correction of the composition of MSR/V and SC.

The flow diagram is described in **Appendix 2**.

375 g sample size was tested for the reference method.

2.3 Study design

The study design depends on the protocol tested. Protocols P1 and P3 were tested as a **paired study design** and protocols P2, P4 and P5 as an **unpaired study design**.

3 INITIAL VALIDATION, EXTENSION/RENEWAL STUDIES: RESULTS

3.1 Method comparison study

The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.

The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.

For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.

3.1.1 Sensitivity study

The sensitivity (SE) is the ability of the method to detect the analyte by either the reference or alternative method.

3.1.1.1 Number and nature of samples

Combining all the categories, 823 samples were tested providing 381 positive and 442 negative results (Protocol 1, 22h incubation time of the RVS) The distribution per tested category, type and protocol is given in **Table 2**.

Table 2 – Distribution per tested category and type

Protocol		Category	Type	Positive	Negative	Total	
Double step enrichment protocol	Protocol 1 PAIRED	9	Dairy products (excluding raw milk) 6h (25 g)	a Raw milk cheese	13	13	26

			b Animal feed	9	12	21	
			c Pet food	9	11	20	
			Total	31	31	62	

Protocol	Positive	Negative	Total
Protocol 1 (6 h), paired	31	39	70
Protocol 1 (22 h), paired	32	38	70
Protocol 2, unpaired	254	308	562
Protocol 3, paired	34	44	78
Protocol 4, unpaired	32	30	62
Protocol 5, unpaired	31	31	62
All categories, paired (P1-6 h+P3)	63	74	137
All categories, paired (P1-22 h+P3)	64	73	137
All categories, unpaired (P2+P4+P5)	317	369	686
All categories, paired and unpaired with protocol 1 at 6h	380	443	823
All categories, paired and unpaired with protocol 1 at 22h	381	442	823

3.1.1.2 Artificial contamination of samples

Naturally contaminated products were preferentially analysed, but artificial contaminations were also carried out using the following protocols

- **Spiking** with injured cells (heat treatment);
- **Seeding** by direct inoculations of low moisture products using lyophilized strains, followed by storage for 2 weeks at ambient temperature before analysis or inoculation by bacteria suspensions and storage for 48-72 h at 3°C ± 2°C.

The injury efficiency was evaluated by comparing enumeration results onto selective and non-selective agars (respectively XLD and TSYEA). The artificial contaminations are presented in **Appendix 3**.

Combining all the categories 367 samples were artificially contaminated using 106 different strains; 4 by cross contamination, 297 gave a positive result.

The repartition of the positive samples per inoculation protocol and inoculation level is given in **Table 3**.

Table 3 - Repartition of the positive samples per inoculation protocol and inoculation level

Categories		Naturally contaminated	Artificially contaminated					Total	
			Spiking protocol			Seeding protocol			Cross contamination
			≤ 5 CFU	5 < x ≤ 10 CFU	>10 CFU	≤ 3 CFU	3 < x ≤ 10 CFU		
All categories	Number of samples	84	125	56	7	84	22	3	381
	%	22%	33%	15%	2%	22%	6%	1%	100%

Combining all the categories, 22 % of the samples were naturally contaminated.

3.1.1.3 Protocols applied during the validation study

> **Enrichment broth incubation time**

The minimum incubation time was applied for each protocol:

Protocol	Enrichment time and temperature
Protocol 1	BPW: 16 h at 37°C RVS: 6 and 24 h at 41,5°C
Protocol 2	16 h at 41,5°C
Protocol 3	20 h at 37°C
Protocol 4	18 h at 37°C
Protocol 5	18 h at 37°C

> **RAPID'Salmonella incubation time**

The plates were incubated for 22 h at 37°C.

> **Confirmation protocols**

The typical colonies were confirmed by the following tests:

Protocol	Tests applied during the study
Protocol 1	Tests of the ISO method (biochemical galleries and serological tests) Oxidase Omni-O
Protocol 2	Tests of the ISO method (biochemical galleries and serological tests) <i>Salmonella</i> Confirm Latex (3556711)
Protocol 3	Tests of the ISO method (biochemical galleries and serological tests) <i>Salmonella</i> Confirm Latex (3556711)
Protocol 4	Tests of the ISO method (biochemical galleries and serological tests) <i>Salmonella</i> Confirm Latex (3556711) iQ-Check <i>salmonella</i> II
Protocol 5	Tests of the ISO method (biochemical galleries and serological tests) Latex <i>Salmonella</i> Thermo Fisher Scientific DR1108A

For the study performed for protocol 5 (pet food and animal feed), in few cases, typical colonies were visible on the plate but were impossible to isolate; they were tested by the iQ-Check *Salmonella*.

For protocols 2, 3 4 and 5, the negative samples, a subculture of the enrichment broth was performed in RVS and MKTTN in order to have the same incubation time as the reference method before streaking onto RAPID' *Salmonella* plates as requested in the ISO 16140-2 (2016).

➤ **Enrichment broth storage 72 h at 5°C ± 3°C**

The enrichment broths from positive and discordant samples were stored for 72 h at 5°C ± 3°C and tested again for protocols 2, 3, 4 and 5.

➤ **RAPID' *Salmonella* plates storage for 72 h at 5°C ± 3°C**

All the plates from positive and negative samples were stored for 72 h at 5°C ± 3°C and read again. The confirmations steps were also applied after storage (API20E, Latex tests and PCR tests). This was tested for studies performed in 2015,2017 and 2020.

> **Lactic flora enumeration**

For products with probiotics, lactic bacteria enumeration was carried out using MRS pH 5.7 incubated in anaerobic conditions for 72 h at 30°C ± 1°C, according to ISO 15214.

3.1.1.4 Test results

Raw data are given in **Appendix 4**. The results are given in **Table 4**.

Table 4 – Interpretation of sample results between the reference and alternative method (based on the confirmed alternative)

Protocol		Category	PA	NA*	PD	ND**	PPND	PPNA	Total

* PPNA not included

** PPND not included

A summary of the results is given in **Table 6**.

Table 6 - Summary of results

		All categories including protocol 1 (6 h)	All categories including protocol 1 (22 h)
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100 \%$	88.9%	89.8 %
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100 \%$	90.0 %	89.8 %
Relative trueness	$RT = \frac{(PA + NA)}{N} \times 100 \%$	90.3 %	90.5 %
False positive ratio for the alternative method* FP = PPNA + PPND	$FPR = \frac{(FP)}{NA} \times 100 \%$	1.1 %	1.1 %

With $ND = ND + PPND$
 $NA = NA + PPNA$

3.1.1.6 Analysis of discordant results

The negative deviations are given in **Table 7** and the positive deviations in **Table 8**.

> **Negative deviations**

Taking into account all the protocols, 42 or 39 negative deviations were obtained respectively for 6 h and 22 h incubation time for protocol 1 (Double step enrichment protocol). They concern 24 artificially contaminated samples and 18 naturally contaminated.

For Protocol 1 (double step enrichment), for two samples (165 and 820), no typical colony was observed on the RAPID'Salmonella plates after 6h incubation of the RVS broth, while typical colonies were observed after incubation of the RVS broth for 24 h at 41,5°C.

For 2 samples in negative deviation (Protocol 2), typical colonies were observed on RAPID'Salmonella plates but were identified as *Cronobacter sakazakii* (sample No 134) and *Serratia liquefaciens* (sample No 8753). These 2 samples were considered as PPND samples.

For protocol 3, 3 negative deviations were observed with a negative confirmation.

For the extension study performed in 2020, four negative deviations were observed; they concern two samples with probiotics and two samples without probiotics.

Note that for one sample (1633: infant formula with probiotics), the presence of *Salmonella* spp was confirmed in the enrichment broth when a subculture was

performed in RVS broth for 48h at 41.5°C before streaking onto RAPID' *Salmonella* plate. This sample was also found positive after storage of the enrichment broth for 72h at 5°C ± 3°C. The contamination level was probably just at the detection limit of the method.

For protocol 5 tested for the category pet food and animal feed (375 g), 3 negative deviations were observed, all the samples were artificially contaminated. For 1 sample (3577: Feed for sheep), the *Salmonella* strain was recovered from a subculture of the supplemented BPW in RVS broth before streaking onto RAPID' *Salmonella* agar plate. The presence of *Salmonella* spp was not confirmed for samples in negative agreement.

> Positive deviations

Combining all the categories, 38 and 39 positive deviations were observed respectively for 6 h and 22 h incubation time for protocol, 27 concern artificially contaminated samples and 12 naturally contaminated samples.

3 positive deviations were observed for protocol 1, 28 for protocol 2.

For protocol 4 tested in 2020, seven positive deviations were observed; they concern one sample with probiotics and six samples without probiotics.

For protocol 5, 2 positive deviations were observed, both for artificially contaminated samples.

The analyses of discordant results according to the EN ISO 16140-2:2016 is the following (See **Table 9**).

** PPND not included

The observed values for ((ND+ PPND) - PD) meet the acceptability limit for each individual category, each protocol and for all the combined categories (calculated values \leq AL).

3.1.1.7 Confirmation

The typical colonies observed on RAPID' *Salmonella* were tested using the tests of the ISO 6579-1, latex test (Latex *Salmonella* Thermo Fisher Scientific DR1108A), biochemical galleries (API 20E) and PCR (iQ-Check *Salmonella*); all the tests concluded to the presence of *Salmonella* spp in the enriched sample. For the extension study concerning protocol 5 (pat food and animal feed, 375 g) when it was not possible to obtain isolated colonies (samples 1735 18 h +72 h, 2780 and 3072 18 h), all the tests concluded to the presence of *Salmonella* spp in the enriched sample except for samples 1735 (72h) and 1729 (72 h) and 1736 (18 h and 18 h + 72 h) for which non-isolated typical colonies were observed but not confirmed as *Salmonella* spp (PPNA sample).

3.1.1.8 Enrichment broth storage and plates storage at 5 ± 3 °C for 72 h

> Plates storage

282 RAPID' *Salmonella* plates (samples representative of the nine categories tested with the short protocol) were stored after incubation and were observed a second time for the presence of characteristic colonies. The changes noticed are listed Table 10). Note that in agreement with the AFNOR Technical committee the plates storage was not evaluated for protocol 5.

For 13 plates, typical colonies appeared after storage for 72 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$. The colonies were identified as *Escherichia coli* for 11 samples and as *Leclercia adecarboxylata* for one sample. Note that in all these cases, the colonies were doubtful and not clearly typical.

The aspect of the *Salmonella* colonies observed immediately after incubation of the RAPID' *Salmonella* plate was not modified during storage and were still considered typical.

The analysis of discordant results is given Table 11.

The observed values for ((ND + PPND)- PD) meet the acceptability limit for each individual category, each protocol and for all the combined categories (calculated values \leq AL) for both enrichment broths and plates storage.

3.1.2 Relative level of detection

The relative level of detection is the level of detection at $P = 0.50$ (LOD_{50}) of the alternative (proprietary) method divided by the level of detection at $P = 0.50$ (LOD_{50}) of the reference method.

The RLOD is defined as the ratio of the alternative and reference methods:

$$RLOD = \frac{LOD_{Alt.}}{LOD_{Ref.}}$$

The relative detection level is the smallest number of culturable micro-organisms that can be detected in the sample in 50% of occasions by the alternative and reference methods.

3.1.2.1 Experimental design

10 (matrix/strain) pairs were analyzed by the reference method and by the alternative method (See **Table 14**):

The following protocol was applied:

- A negative control: 5 samples,
- A low contamination level providing fractional recovery data, with 20 replicates,
- A high contamination level, with 5 replicates.

A total plate count determination on each matrix was performed to estimate the total microbial load on the day of analysis.

Table 14 - Defined (matrix/strain) pairs for the RLOD determination

Year of analysis	Protocol	Matrix	Inoculated strain	Origin	Storage conditions before analysis

3.1.2.2 Calculation and interpretation of the RLOD and LOD₅₀

The raw data are given in **Appendix 5**.

The RLOD calculations were performed using the Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 06.07.2015. The RLOD are given **Table 15**.

**Table 15 – Presentation of RLOD before and after confirmation
of the alternative method results**

The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 1.5 for paired studies or 2.5 for unpaired studies, for all matrix/strain pairs tested.

The LOD₅₀ varies from 0.5 to 1.2 CFU/sample size for the reference method and from 0.3 to 1.2 CFU/ sample size for the alternative method.

¹ Wilrich, C., and P.-Th. Wilrich: Estimation of the POD function and the LOD of a qualitative microbiological measurement method. AOAC International **92** (2009) 1763 - 1772.

3.1.3 Inclusivity / exclusivity

The inclusivity is the ability of the alternative method to detect the target analyte from a wide range of strains. The exclusivity is the lack of interference from a relevant range of non-target strains of the alternative method.

3.1.3.1 Double step enrichment protocol:

> Protocols

- **Inclusivity:** The *Salmonella* strains were cultured in BHI at 37°C. Dilutions were done in order to inoculate between 10 to 100 CFU/225 ml BPW. The protocol of the alternative was then applied.
- **Exclusivity:** The negative strains were cultured in BHI, incubated at 37°C and subcultured at a rate of approximately 10⁵/ml in buffered peptone water on RAPID'*Salmonella*. In cases where typical colonies on RAPID'*Salmonella* agar were obtained, the complete protocol was applied.

> Results

The results are presented in **Appendix 6**.

> Inclusivity

All target strains show typical colonies on RAPID'*Salmonella* agar, except for the *Paratyphi* A ATCC 9150 strain. The latter presents typical red colonies [H₂S]- on XLD agar and atypical colonies on Rambach agar. The OMNI-O test is positive, concordant with the API20E confirmation result. Two other strains of *Salmonella paratyphi* A (ATCC 11511 and CIP 5541) were tested and showed typical magenta colonies on RAPID'*Salmonella* agar. The *Typhi* Ad 302, *Paratyphi* B Ad301 and *Paratyphi* C ATCC 13428 strains are also typical on RAPID'*Salmonella* agar.

All target strains show a OMNI-O positive /ONPG negative profile, except for *Salmonella arizonae* CIP 5523, salmonella having a [lactose] positive phenotype, present an ONPG positive test.

> **Exclusivity**

All non-target strains tested did not present typical colonies on RAPID'Salmonella agar when carrying out the complete protocol, except for an *Enterobacter sakazakii* strain that showed a negative OMNI-O test, non-specific for salmonella.

During the accuracy study, two strains identified as the *Escherichia hermanii* specie presented typical colonies on RAPID'Salmonella agar that was OMNI-O positive and ONPG positive. In order to evaluate the selectivity of confirmation tests for this specie, twelve additional strains of *Escherichia hermanii* were tested. Eight showed a positive reaction to the OMNI-O test, but they all presented a positive reaction to the ONPG test.

3.1.3.2 Short protocol

Inclusivity and exclusivity studies were performed during the initial validation study and extension studies:

- For inclusivity: in 2009, 2011 and 2012: BPW + supplement incubated for 18 h \pm 2 h at 41.5°C;
- For exclusivity: in 2009, 2011 and 2012: BPW incubated for 18 h \pm 2 h at 41.5°C.

> **Initial validation (2009)**

- **Inclusivity Protocol:** The *Salmonella* strains were grown in BHI at 37°C. A dilution of the culture was performed and inoculated in buffered peptone water incubated at 41.5°C in order to inoculate between 10 and 100 cells per 225 ml of broth. The protocol of the alternative method was then applied.
- **Exclusivity Protocol:** The negative strains were thawed in BHI, incubated at 37°C and inoculated around 10⁵/ml of buffered peptone water at 41.5°C. Streaking was then carried out on RAPID'Salmonella. In cases where typical colonies on RAPID'Salmonella agar were obtained, the latex test was carried out.

> **Extension study (2011)**

The testing was done in order to verify that *Salmonella* spp strains with low esterase activity show characteristic colonies on RAPID'Salmonella agar.

Five *Salmonella* Dublin and two *Salmonella bongori* strains were tested.

One *Salmonella* Braenderup, one *Salmonella* Enteritidis and one *Salmonella* Typhimurium were also tested as positive controls.

> Extension study (2012)

The aim of this study was to obtain an extension for using two latex tests to confirm the typical colonies isolated on RAPID' *Salmonella* plates.

After thawing in BHI broth for 24 h at 37°C, a subculture was performed in supplemented BPW, incubated for 16 - 20 h at 41.5°C for the target strains and in BPW, incubated for 16 - 20 h at 37°C. A streaking onto TCS plates was also performed.

Two latex tests were then applied on the colonies from RAPID' *Salmonella* for the target strains when a negative or doubtful result was observed, from TCS for non-target strains.

Two latex tests were used: OXOID *Salmonella* latex test and *Salmonella* Confirm latex test.

3.1.3.3 Results

> Initial validation (2009)

- **Inclusivity:** among the 51 tested *Salmonella* strains, 47 gave typical colonies on RAPID' *Salmonella* agar. The *Salmonella* Paratyphi A ATCC 9150, *Salmonella* Paratyphi C ATCC, *Salmonella* Gallinarium A300, 13428 and *Salmonella* Paratyphi B Ad301 didn't grow on RAPID' *Salmonella* and gave atypical colonies. After growing in BHI, all the *Salmonella* Paratyphi strains tested gave typical colonies on RAPID' *Salmonella* agar.

Five strains gave negative latex test: *Salmonella arizonae* Ad450, *Salmonella bongori* Ad599, *Salmonella Cerro* Ad689, *Salmonella Houtenae* Ad596 and *Salmonella Veneziana* Adria 233.

- **Exclusivity:** 42 negative strains including 12 *Escherichia hermannii* were tested. 11 *Escherichia hermannii* strains gave magenta colonies: some of them with pale colour. This result was also observed with *Citrobacter diversus* Adria 140 and *Serratia marescens* Ad447; all the stains gave a negative latex test.

Raw data are given in **Appendix 7**.

> Extension study (2011)

The results are summarized hereafter (See Table 15).

Table 17 - Inclusivity results

N°	Genus	Species	Origin	Inoculation CFU/225ml Supplemented BPW	Colonies on RAPID' <i>Salmonella</i>	Latex test
1	Salmonella	Braenderup Ad915	Raw poultry	9	magenta	+
2	Salmonella	Enteritidis Ad926	Paella	4	magenta	+
3	Salmonella	Typhimurium 305	Paella	7	magenta	+
4	Salmonella	<i>bongori</i> Ad598	Environmental sample	6	magenta	-
5	Salmonella	<i>bongori</i> Ad599	Poultry	12	magenta	-
6	Salmonella	Dublin Ad528	Pancake batter	5	magenta	+
7	Salmonella	Dublin Ad529	Steak	6	Pale magenta	+
8	Salmonella	Dublin Ad530	Ground beef	9	Pale magenta	+
9	Salmonella	Dublin Ad531	Raw milk cheese	4	Pale magenta	+
10	Salmonella	Dublin Ad1336	Raw milk cheese	22	Pale magenta	+

All the tested *Salmonella* Dublin and *Salmonella bongori* strains show characteristic colonies. Some of these strains show a pale magenta color in comparison to the tested *Salmonella* Enteritidis, *Salmonella* Braenderup and *Salmonella* Typhimurium.

➤ Extension study (2012)

The results are provided in **Appendix 8**. A summary of the results is provided in Table 16.

Table 18

	RAPID' <i>Salmonella</i>		TCS	
	Latex test		Latex test	
	OXOID*	<i>Salmonella</i> Confirm Latex*	OXOID*	<i>Salmonella</i> Confirm Latex *
Number of tested strains	151 **	151**	14	43
Positive result	138	109	14	5
Negative result	6	41	0	30
Weak agglutination	1	1	0	8
Doubtful agglutination	6	0	0	0

* In order to confirm or infirm the negative observed results, the tests were performed again with two technicians.

** *Salmonella* Kentucky CIP 105623 did not grow on RAPID' *Salmonella* and was only tested from TCS plate. Wild strains from the same serotype were tested and gave typical colonies on RAPID' *Salmonella* and positive latex tests.

> Target strains

Among the 152 tested strains, 145 gave a positive result with the OXOID latex test, and 110 with the *Salmonella* Confirm Latex test. The strains which gave a negative latex test, or a weak positive result were also tested from TCS plates. All the strains gave them positive latex tests (OXOID and *Salmonella* Confirm Latex test).

Note that after the RAPID' *Salmonella* method, main of the strains belonging to an another species than *enterica enterica* was not detected by the *Salmonella* Confirm Latex test. Some strains from *S. enterica enterica* species gave also negative latex tests: 28.3 % of the tested strains (43 strains/152) gave negative results during the study after the RAPID' *Salmonella* protocol. Only 5 strains among the 43 strains were positive after growth on non-selective agar plates; 30 strains still gave a negative agglutination test and 8 a positive or weak agglutination.

After the RAPID' *Salmonella* protocol, the OXOID Latex tests showed negative results with *S. enterica enterica* strains. All these strains showed an agglutination after growth on non-selective agar plates. Only 3.9 % of the strains did not show an agglutination after the RAPID' *Salmonella* method.

> Non-target strains

Among the 100 tested strains, 82 grew on the RAPID' *Salmonella* plates. Only one strain (*Serratia marcescens* Ad447) gave blue magenta colonies; the OXOID and *Salmonella* Confirm Latex tests were negative with this strain. A summary of the results is presented in Table 17.

Table 19

	RAPID' <i>Salmonella</i>		TCS	
	Latex test		Latex test**	
	OXOID	<i>Salmonella</i> Confirm latex	OXOID	<i>Salmonella</i> Confirm latex
Number of tested strains	82	82	100	100
Negative test	69	76	77	81
Auto agglutinable strains	4	0	12	4
Doubtful agglutination	8*	3*	7	5
Weak agglutination	0	2*	0	1
Positive test	1*	1*	4	9

* Non characteristic strain on RAPID' *Salmonella* agar.

** Note that this study shows only the selectivity of the latex tests regarding the non-target strains grown on non-selective agar plates. The objective of the study is not to test the performances of the RAPID' *Salmonella*.

Only one strain gave a clearly positive latex test after streaking onto RAPID' *Salmonella* agar with the two latex tests: *Citrobacter farmeri* Ad1116. This strain gave dark blue non-typical colonies on RAPID' *Salmonella* agar.

A clear difference is noticed between the two latex tests during this study. The OXOID latex test showed the best performances regarding the specificity and the selectivity which are satisfying.

> Renewal study (2017)

49 non-target strains were tested using the short protocol. The results are given in **Appendix 9**.

For 2 strains (*Salmonella* Abortusequi Ad2331 and *Salmonella* Abortusovis Ad2320), the RAPID' *Salmonella* plates required an incubation time of 48 h to observe typical colonies.

For 2 strains, addition of milk for the enrichment step was necessary to recover the plates but note that for *Salmonella* Strasbourg CIP 105632, blue colonies were observed and for *Salmonella* Wayne, the colonies were very small.

The 3 latex tests gave positive results with all the *Salmonella* strains but sometimes with a weak or very weak reaction.

3.1.4 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

Storage conditions, shelf-life and modalities of utilisation after first use	<p>The storage temperature and the expiry date are indicated on the plates of RAPID' <i>Salmonella</i>, on the bottle for dehydrated RAPID' <i>Salmonella</i>, on the bottle for the latex test and on the bottle for the RAPID' <i>Salmonella</i> Capsule supplement. The shelf-life is:</p> <ul style="list-style-type: none"> - RAPID' <i>Salmonella</i> (pre-filled plates): 3 months at 4°C, - RAPID' <i>Salmonella</i> format 500 g: 24 months at 4°C, - Latex Kitt: 18 months at 4°C, - RAPID' <i>Salmonella</i> capsule: 18 months at 4°C. 			
Time to result	Steps	Reference method	Alternative method	
			Short protocol	Double step enrichment protocol
	Negative samples			
	Pre-enrichment	Day 0	Day 0	Day 0
	Enrichment	Day 1	/	Day 1
	Streaking	Day 2-Day 3	Day 1	Day 1 or Day 2
	Reading plates, obtaining negative results	Day 3-Day 4	Day 2	Day 2 or Day 3
	Presumptive positive or positive results			
	Pre-enrichment	Day 0	Day 0	Day 0
	Enrichment	Day 1	/	Day 1
	Streaking	Day 2-Day 3	Day 1	Day 1 or Day 2
	Selective agar readings, purification of colonies	Day 3-Day 4	Day 2	Day 2 or Day 3
	Confirmation tests, final results	Day 4Day 6	Day 2	Day 2 or Day 3
Common step with the reference method	<p>No common step for the short protocol. Pre-enrichment step for the double step enrichment protocol.</p>			

The negative results are available in one day and the positive results in two days when using the short protocol on the shorter incubation time for the RVS broth in the double step enrichment protocol.

3.2 Inter-laboratory study

The aim of the inter-laboratory study is to determine the variability of the results obtained in different laboratories using identical samples and to compare these results with those obtained in the method comparison study.

The inter-laboratory study was run in 2005 using the double step enrichment protocol. The interpretation of the data is done according to the EN ISO 16140-2:2016.

3.2.1 Study organisation

> Collaborators number

Samples were sent to 15 laboratories.

> Matrix and strain used

Pasteurized half-skimmed milk was inoculated with *Salmonella* Typhimurium 305.

> Samples

Samples were prepared and inoculated on Monday 17th of October 2005, as described below:

- 24 samples for analysis by the alternative and the reference methods;
- 1 sample for aerobic mesophilic flora enumeration by ISO 4833-1 method,
- 1 water flask labelled "Temperature Control" with a temperature probe.

> Inoculation

The targeted inoculation levels were the following:

- Level: 0 CFU/25 ml,
- Level 1: 5 CFU/25 ml, inoculation level providing as much as possible fractional positive recovery data;
- Level 2: 25 CFU/25 ml.

> *Labelling and shipping*

Blind coded samples were placed in isothermal boxes, which contained cooling blocks, and express-shipped to the different laboratories.

A temperature control flask containing a sensor was added to the package in order to register the temperature profile during the transport, the package delivery and storage until analyses.

Samples were shipped in 24 h to 48 h to the involved laboratories. The temperature conditions had to stay lower or equal to 8°C during transport, and between 0°C – 8°C in the labs.

> *Analyses*

Collaborative study laboratories and the expert laboratory carried out the analyses on Day 1 with the alternative and reference methods.

3.2.2 *Experimental parameters controls*

3.2.2.1 *Strain stability and background microflora stability*

Strain stability was checked by inoculating the matrix at 5 CFU/25 ml and 25 CFU/25 ml. Enumerations were performed for the high contamination level and detection analyses were performed for the low contamination level after 24 h and 48 h storage at $5 \pm 3^\circ\text{C}$ (See Table 20).

Table 20 - Sample stability

Day	Reference method and alternative methods (detection)	CFU/25 ml
Day 0	+	18
Day 1	+	7.5
Day 2	+	20

No evolution was observed during storage at $5^\circ\text{C} \pm 3^\circ\text{C}$.

3.2.2.2 *Contamination levels*

The contamination levels and the sample codification were the following (see Table 21).

Table 21 - Contamination levels

Level	Samples	Theoretical target level (b/25 ml)	True level (b/25 ml sample)	Low limit / 25 ml sample	High limit / 25 ml sample
Level 0	1, 3, 6, 8, 11, 13, 22, 24	/	/	/	/
Low level	2, 4, 10, 12, 15, 17, 21, 23	5	6	5	7
High level	5, 7, 9, 14, 16, 18, 1, 20	25	26	23	30

3.2.2.3 Logistic conditions

Temperature conditions are given in Table 22.

Table 22 - Sample temperatures at receipt

Collaborators	Temperature measured by the probe (°C)	Temperature measured at receipt (°C)	Receipt delay of the samples
A	0	5,0	Day 1
B	0,5	7,0	
C	0,5	1,7	
D	0,5	4,0	
E	0	2,5	
F	0	1,9	
G	0 - 0,5	5,2	
H	0	4,8	
I	0	0,8	
J	0,5	1,3	
K	0	6,0	
L	0	3,6	
M	0,5 - 0	4,9	
N	0,5	2,0	
O	1,0	5,5	

No problem was encountered during the transport or at receipt for the 15 collaborators. All the samples were delivered on time and in appropriate conditions. Temperatures during shipment and at receipt were all correct.

3.2.3 Results analysis

The raw data are given in **Appendix 10**.

3.2.3.1 Expert laboratory results

The results obtained by the expert laboratory are given in Table 23.

Table 23 – Results obtained by the expert Lab.

Level	Reference method	Alternative method
L0	0/8	0/8
L1	8/8	8/8
L2	8/8	8/8

3.2.3.2 Results observed by the collaborative laboratories

> **Aerobic mesophilic flora enumeration**

Depending on the Lab results, the enumeration levels varied from $3.1 \cdot 10^3$ to $3.6 \cdot 10^6$ CFU/g.

> **Salmonella detection**

15 collaborators participated to the study. The results obtained are provided in Table 24 (reference method) and Tables 25 and 26 (alternative method).

**Table 24 - Positive results by the reference method

Total	P₀ = 27	CP₀ = 24	P₁ = 120	CP₁ = 120	P₂ = 120	CP₂ = 120

A lot of unspiked samples showed typical colonies on selective agar plates for both methods (reference and alternative). 14 samples were concerned for the reference method, 6 and 24 for the alternative method for respectively 6 h and 24 h incubation time of the RVS broth.

The hypothesis of contaminations was confirmed by a molecular characterization of isolates by pulsotyping in accordance with the AFSSA protocol available in the MATEAS database (cf. See figure below).

As the cross contaminations occurred mainly after 24 h incubation time of the RVS broth, **it is proposed to keep only the data observed after 8 h ± 2 h incubation time for interpretation.**

3.2.3.3 Results of the collaborators retained for interpretation

According to the AFNOR technical rules, it is possible to include the results from a collaborator with maximum one cross contamination at Level 0. For this study, this rule was applied and the results from Labs C, G, K, M and O were removed from interpretation.

The results obtained with the 10 labs kept for interpretation are presented in Table 27 (reference method) and Table 28 (alternative method).

**Table 27 - Positive results by the reference method

3.2.4 Calculation and interpretation

3.2.4.1 Calculation of the specificity percentage (SP)

The percentage specificities (SP) of the reference method and of the alternative method, using the data after confirmation, based on the results of level L0 are the following (See Table 29).

Table 29 - Percentage specificity

Specificity for the reference method	$SP_{ref} = \left(1 - \left(\frac{P_0}{N_-} \right) \right) \times 100 \% =$	100 %
Specificity for the alternative method	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-} \right) \right) \times 100 \% =$	100 %

N: number of all L0 tests

P_0 = total number of false-positive results obtained with the blank samples before confirmation

CP_0 = total number of false-positive results obtained with the blank samples

3.2.4.2 Calculation of the sensitivity (SE_{alt}), the sensitivity for the reference method (SE_{ref}), the relative trueness (RT) and the false positive ratio for the alternative method (FPR)

Fractional positive results were obtained for the low inoculation level. Only this inoculation level was retained for calculation.

A summary of the results of the collaborators retained for interpretation, and obtained with the reference and the alternative methods for Level 1 is provided in Table 30.

Table 30 - Summary of the obtained results with the reference method and the alternative method for Level 1

Incubation time	Response	Reference method positive (R+)	Reference method negative (R-)
6 h	Alternative method positive (A+)	Positive agreement (A+/R+) PA = 80	Positive deviation (R-/A+) PD = 0
	Alternative method negative (A-)	Negative deviation (A-/R+) ND = 0 (PPND = 0)	Negative agreement (A-/R-) NA = 0 (PPNA = 0)

Based on the data summarized in Table 30, the values of sensitivity of the alternative and reference methods, as well as the relative trueness and false positive ratio for the alternative method taking account the confirmations, are the following (See Table 31).

Table 31 - Sensitivity, relative trueness and false positive ratio percentages

		6 h
Sensitivity for the alternative method:	$SE_{alt} = \frac{(PA+PD)}{(PA+PD+ND)} \times 100\% =$	100 %
Sensitivity for the reference method:	$SE_{ref} = \frac{(PA+ND)}{(PA+PD+ND)} \times 100\% =$	100 %
Relative trueness	$RT = \frac{(PA+NA)}{N} \times 100\% =$	100 %
False positive ratio for the alternative method	$FPR = \frac{FP}{NA} \times 100\% =$	/ *

* Calculation not possible (NA = 0)

3.2.4.3 Interpretation of data

For a **paired study design**, the difference between (ND – PD) and the addition (ND + PD) are calculated for the level(s) where fractional recovery is obtained (so L_1 for this study). The observed value found for (ND – PD) and (ND + PD) shall not be higher than the AL.

For 10 Labs, the limits are the following:

	Calculated values	AL	Conclusion
ND - PD	0	3	ND - PD ≤ AL
ND + PD	0	4	ND + PD ≤ AL

The EN ISO 16140-2:2016 requirements are fulfilled as (ND - PD) and (ND + PD) meet the Acceptability Limit (calculated values ≤ AL).

3.2.4.4 Evaluation of the LOD_{50%}, LOD_{95%} and RLOD between laboratories

The RLOD was calculated using the EN ISO 16140-2:2016 Excel spreadsheet available at https://standards.iso.org/iso/16140/-5/ed-1/en/RLOD_inter-lab-study_16140-2_AnnexF_ver1_28-06-2017.xls. The results are used only for information (see Table 32).

Table 32 - LOD_{50%}, LOD_{95%} and RLOD

Method	LOD 50%	LOD 95%	RLOD
Reference	0.95 [0.60; 1.49]	4.10 [2.61; 6.40]	/
Alternative	Calculation impossible as every inoculated sample is positive		

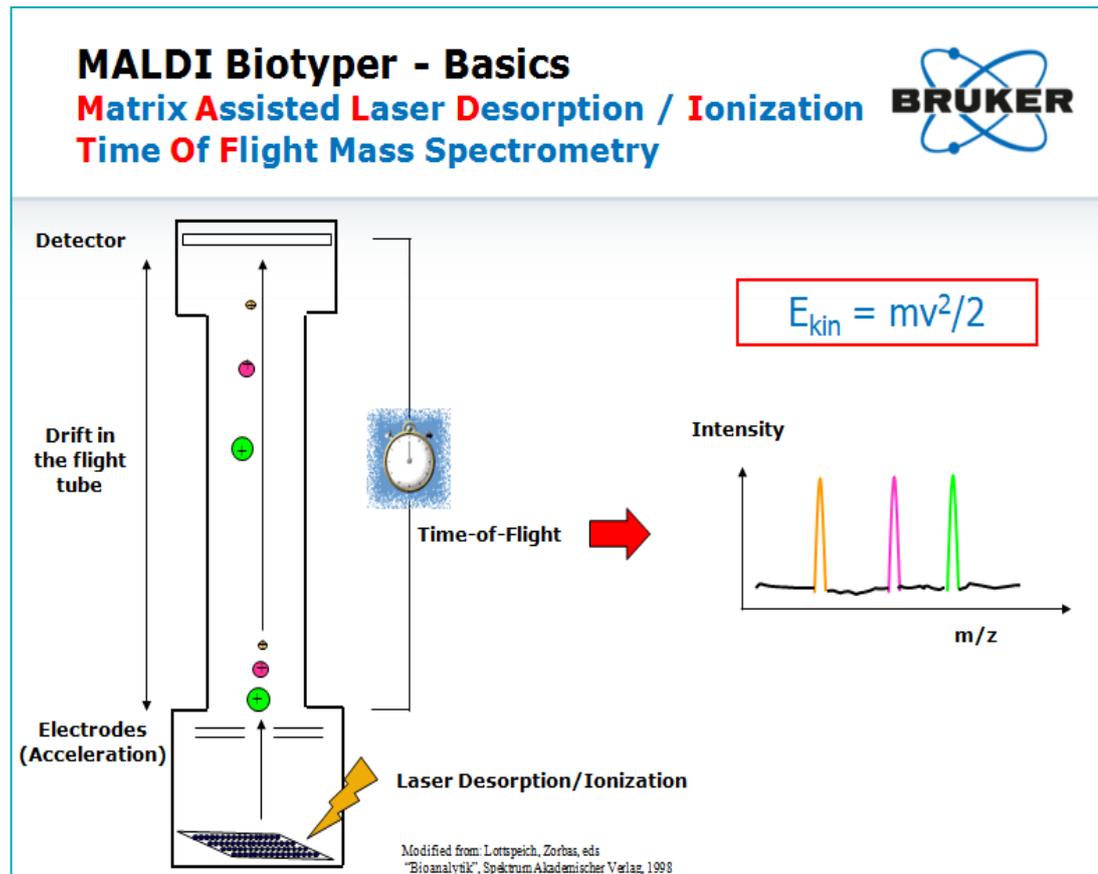

4 EXTENSION STUDY FOR USING THE BIOTYPER FROM BRUKER FOR CONFIRMATION

This extension concerns the possibility to confirm the typical colonies isolated on RAPID[®] *Salmonella* plates using the Biotyper from Bruker.

4.1 Principle

The MALDI Biotyper[®] Complete solution (MBT) uses a method based on mass spectrometry for rapid identification of organisms from microbial cultures. The principle of the method is summarized in Figure 1.

Figure 1

The MBT workflow gathers three sample preparation procedures, which are presented in **Appendix 11**:

1. Direct transfer sample preparation procedure (DT), which is the usual procedure for most of the bacterial isolates and is used as the general procedure;
2. Extended direct transfer sample preparation procedure (eDT).
3. Extraction sample preparation procedure (EXT).

eDT and EXT sample preparations are used when recommended, based on the calculating log (score) value.

The MBT is based on:

- The instrument MALDI-Time-Of-Flight Mass Spectrometer for accurate mass determination of biomolecules)
- The MBT Compass which is a software package for microorganism identification based on MALDI-TOF MS profile spectra; the MBT Compass software controls mass spectrometry data acquisition and, for identification purposes, matches acquired spectra against the MBT Compass library. The software generates an

easily understandable report using score values and scoring symbols as shown below (Table 33).

Table 33

Value	Description	Symbols	Color
2.00 – 3.00	High confidence identification	(+++)	Green
1.70 – 1.99	Low confidence identification	(+)	Yellow
0.00 – 1.69	No possible identification	(-)	Red

Based on the Consistency Category of the MBT Compass Manual, log (scores) higher or equal 2.0 are presented in green and are determined to be acceptable to the species level.

Results presented in yellow have values between 1.70 and 1.99. These values are determined to be acceptable to the genus level. **For the confirmation of foodborne pathogens at the genus level, the two best matches shall be considered, showing both log (scores) > 1.7 and the same identified genus. This is therefore applicable in the current study.**

Results presented in red are strictly lower than 1.7 and are considered not acceptable for identification. If the log (score) is < 1.70 after initial analysis, the DT sample preparation shall be repeated, and if needed the alternative sample preparation procedures, eDT and EXT, shall be run. If the identification is still not possible, it is advised to streak on a non-selective agar.

For this extension study, the MBT system Microflex LT/SH was used with the following software:

- Flex control 3.4 (Build 135);
- MBT Compass Explorer 4.1 (version 80).

4.2 Protocol

Microorganisms to be confirmed using the MBT were isolated by streaking a microbial culture onto a RAPID'*Salmonella* and a TSA plates. The protocol is described **Appendix 12.**

4.3 Strains

156 positive and 101 negative strains were tested.

4.4 Results

The raw data are provided in **Appendix 13**.

Only the identified genus is presented in the raw data as the tests were run for confirmation purpose. However, the MALDI Biotyper provides the identification at the species level.

The number of strains tested per plate as well as the sample preparation procedure applied are summarized in Table 34.

Table 34 - Number of strains tested per plate as well as the sample preparation procedure applied

	Media	No growth	Number of strains tested	Number of strains giving non-characteristic colonies on the plates	Sample preparation procedure		
					DT ²	eDT ³	EXT ⁴
Inclusivity	TSA	0	156	0	156 (100 %)	0 (0 %)	0 (0 %)
	RAPID' <i>Salmonella</i>	4	152	7	151 (99.3 %)	1 (0.7 %)	0 (0 %)
Exclusivity	TSA	0	101	0	97 (96.0 %)	2 (2.0 %)	2 (2.0 %)
	RAPID' <i>Salmonella</i>	36	65	62	61 (93.8 %)	2 (3.1 %)	2 (3.1 %)

² DT: Direct Transfer

³ eDT: extended Direct Transfer procedure

⁴ Extraction Procedure

> Inclusivity

For the inclusivity panel, all the strains were able to grow on TSA plates; they were all confirmed as *Salmonella* spp.

152 strains grew on the RAPID' *Salmonella* agar plates, seven showed atypical colonies. They were all confirmed as *Salmonella* spp

4 strains did not grow and thus were not tested from RAPID' *Salmonella* agar plates using the Biotyper:

- *Salmonella arizonae* 50:z4, 223
- *Salmonella* Abony CIP 8039,
- *Salmonella* Gallinarum biovar Pullorum Ad300,
- *Salmonella* Poona CIP 107125.

> Exclusivity

The 101 non target strains were tested from TSA plates

Among these 101 strains, 36 strains were not able to grow on RAPID' *Salmonella* plates. 65 grew, 62 gave atypical colonies and 3 gave doubtful colonies.

The confirmation result was negative for 99 strains when tested from the TSA plates. For 2 strains (*Glucunobacter cerivus* Ad374, *Psychrobacter psychrophilus* Ad343), no result was available even when using the extraction procedure (EXT). Note that no *Psychrobacter psychrophilus* is present in the Biotyper library. For *Glucunobacter cerinus*, only one strain is listed in the library.

When the non-target strains were tested from RAPID' *Salmonella* plates (65 strains), the confirmation was negative using the MALDI Biotyper of Bruker.

For information, most of the strains were identified using classical identification procedures with biochemical tests.

Some disagreements between the former identification with biochemical galleries and the MBT identifications are highlighted in the raw data; 11 are reported.

Only the use of a third method recognized as a reference for taxonomy purpose can help in making a clear conclusion about some observed disagreements.

Three 16S rDNA sequences (less than 700 pb) are additionally available. Two of the 16S rDNA sequences for the former A00C068 and 10 *Enterobacter* spp strains provide finally a third possible name of species, it is in that cases not possible to conclude (lines 30 and 31). The classification of such isolate is probably still ambiguous for these isolates. The identity of the strain *Enterobacter kobei* Ad342 (Line 40) is confirmed with 16S rDNA sequencing.

The other disagreements observed for *Enterobacter* strains can be easily explained with the recent changes in the taxonomy for the *Enterobacter* genus. Some of the isolates are now belonging to the genera *Cronobacter*, *Franconibacter*, *Kosakonia*, *Lelliottia*, *Pluralibacter*, *Siccibacter*....

At least, the comparison of the reference spectra of the MBT Library was run for the observed disagreements, to evaluate the possibility of mismatching. The comments are provided in the raw data. Some of the comparisons show score values strictly below the threshold of 1.70, excluding mismatching.

No misidentification to *Salmonella* is observed, and the MALDI Biotyper suits for *Salmonella* confirmation from RAPID' *Salmonella* chromogenic plates.

4.5 Conclusion

In most of the cases, the Direct Transfer procedure (DT) allowed to confirm the strains from TSA and RAPID' *Salmonella* plates (100 and 99.3 %) for inclusivity and (96.0%. and 93.8 %) for exclusivity.

The MALDI Biotyper is a reliable method for confirmation of the colonies in the RAPID' *Salmonella* method, from TSA or RAPID' *Salmonella* plates.

5 CONCLUSION

The method comparison study scheme corresponds to an UNPAIRED STUDY design as the alternative and reference methods have different enrichment procedures except for the categories milk powders (protocol 3) and dairy products excluding raw milk (protocol 1) which correspond to a PAIRED STUDY design.

In the sensitivity study, 11 categories were tested: 8 food categories, 2 Pet food and animal feed categories (25 g and 375 g test portion) and the production environmental samples. The protocol of the alternative method shows 38 or 39 positive deviations (PD) and 42 or 39 negative deviations (ND) for the overall categories depending on the incubation time tested for the RVS broth for protocol 1 (6 h or 22 h). The ND - PD meet the acceptability limits (AL) whatever the categories, the protocols, and as well for the 11 tested categories.

The Relative Levels of Detection (RLOD) are all below the AL fixed at 2.5 for the unpaired data study or 1.5 for the paired data study whatever the matrix/strain pairs.

The inclusivity and exclusivity testing gave satisfying results.

It is possible to store the enrichment broth (BPW with or without supplement depending on the protocol tested) and the plates for 72 h at $5 \pm 3^{\circ}\text{C}$ for the short protocols (protocols 2, 3, 4 and 5).

The alternative method allows a two-days screening of the negative samples (short protocol and shorter incubation time of the double enrichment step protocol).

The alternative method fulfils all the EN ISO 16140-2:2016 and AFNOR technical rules (PR revision 7).

The MALDI Biotyper is a reliable confirmatory test for the RAPID' *Salmonella* method.

For the inter-laboratory study, the data and interpretations comply with the EN ISO 16140-2:2016 requirements. The RAPID' *Salmonella* is considered equivalent to the ISO standard.

Quimper, 16 March 2023

Validation of Alternative methods

Food Safety & Quality

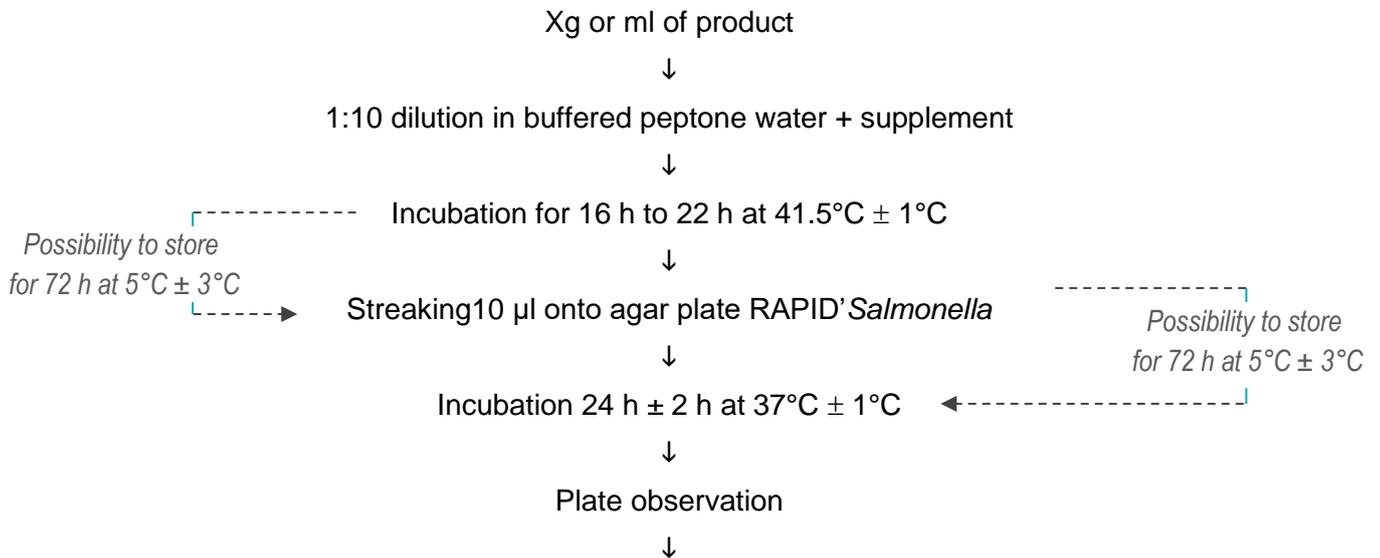

A handwritten signature in blue ink, appearing to be 'M. Rannou', is written over the text 'Validation of Alternative methods' and 'Food Safety & Quality'.

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

Appendix 1 – Flow diagram of the alternative method: RAPID' *Salmonella***Double step enrichment protocol****Protocol 1: Dairy products, excluding raw milk**

Short protocol

Protocol 2: All human food, animal feed products (25 g sample size) and environmental samples

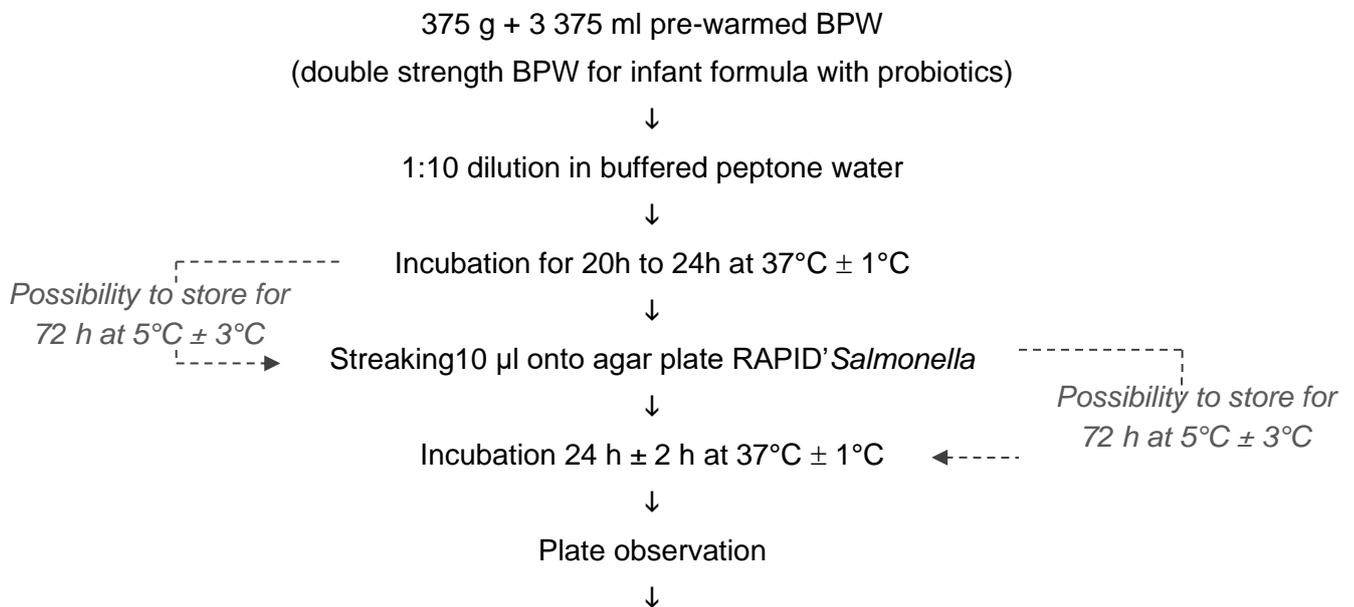

Typical colonies are confirmed by:

- The tests described in the reference method
- Latex tests (Salmonella Latex Test (BIO-RAD), CONFIRM Salmonella Latex (BIO-RAD), Latex Salmonella (OXOID))
- PCR test
- Oxidase, OMNI-O, ONPG
- MALDI Biotyper from Bruker

Short protocol

Protocol 3: Milk powders including infant formula (with and without probiotics) and related ingredients (375 g sample size)

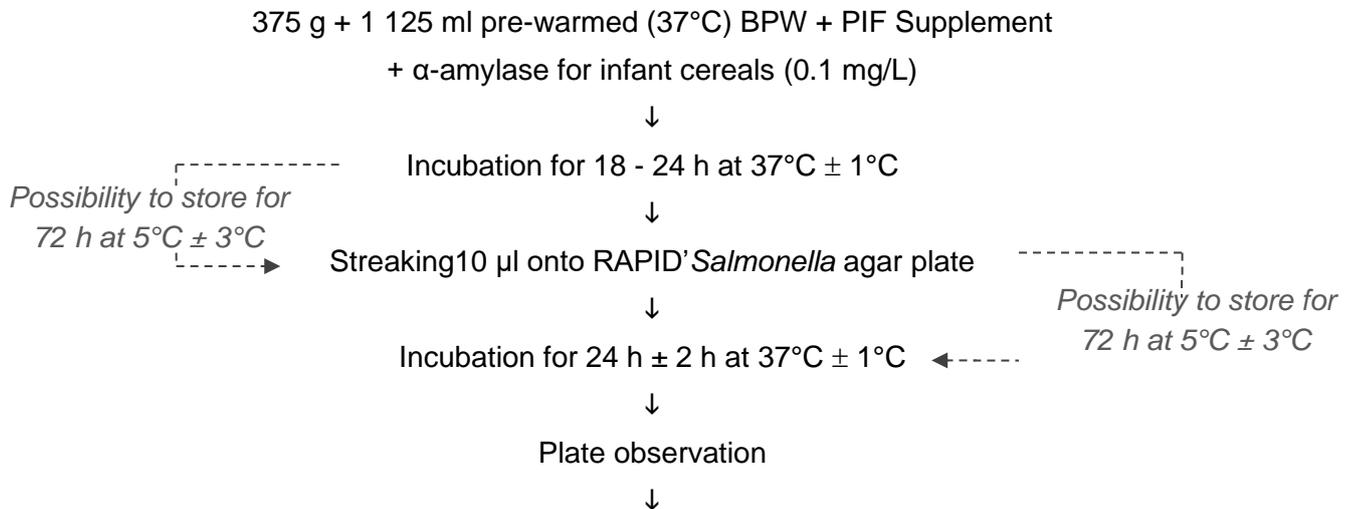

*Possibility to store for
72 h at 5°C ± 3°C*

*Possibility to store for
72 h at 5°C ± 3°C*

- The tests described in the reference method
- Latex test (Salmonella Latex Test (BIO-RAD), CONFIRM Salmonella Latex (BIO-RAD), Latex Salmonella (OXOID))
- PCR test
- Oxidase, OMNI-O, ONPG
- MALDI-Biotyper from Bruker

Short protocol

Protocol 4: Infant formula and infant cereals with or without probiotics including ingredients

*Possibility to store for
72 h at 5°C ± 3°C*

*Possibility to store for
72 h at 5°C ± 3°C*

- The tests described in the reference method
- Latex test (Salmonella Latex Test (BIORAD), CONFIRM Salmonella Latex (BIORAD), Latex Salmonella (OXOID))
- PCR test
- MALDI-Biotyper from Bruker

Short protocol**Protocol 5: Pet food and animal feed**

375 g + 1875 ml pre-warmed BPW + RSLM supplement (d 1:6)

Incubation for 18-24 at $37.0^{\circ}\text{C} \pm 1^{\circ}\text{C}$

*Possibility to store
for 72 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$*

Streaking 10 μl onto agar plate RAPID' *Salmonella*

*Possibility to store
for 72 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$*

Incubation 24 h \pm 2 h at $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$

Plate observation

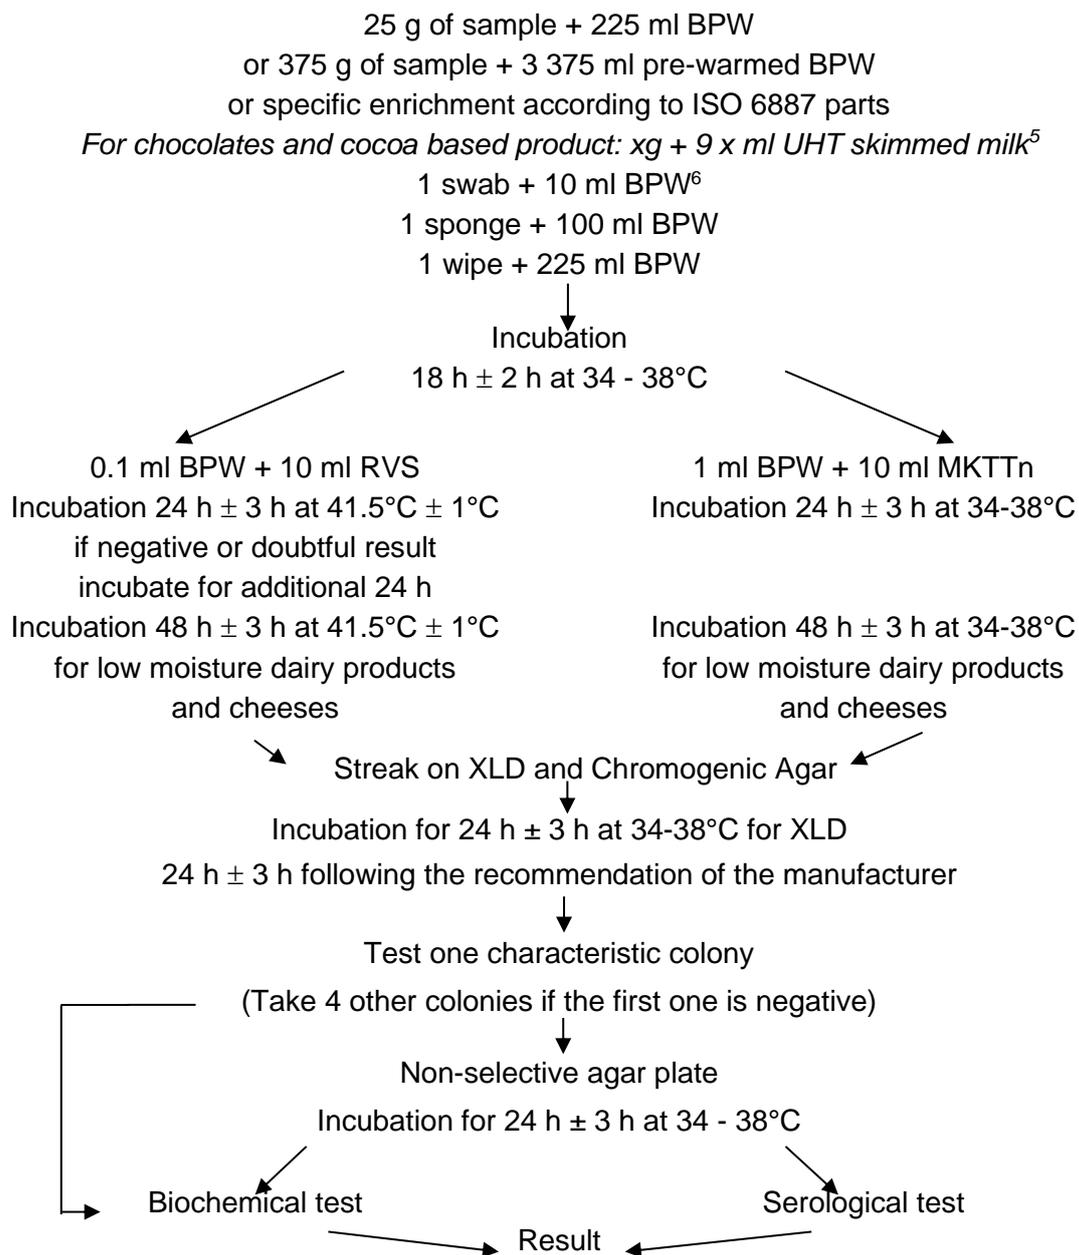

Typical colonies are confirmed by:

- The tests described in the reference method
- Latex tests (Salmonella Latex Test (BIO-RAD), CONFIRM Salmonella Latex (BIO-RAD), Latex Salmonella (OXOID))
- PCR test
- MALDI Biotyper from Bruker

Appendix 4 - Sensitivity study: raw results

Results 1 - Double enrichment step protocol	95
Results 2 - Short protocols	97

Bold typing: artificially inoculated samples

Salmonella detection results:

m:	minority level of target analyte
M:	majority level of target analyte
p:	pure culture level of target analyte
1/2:	50% level of target analyte
(x):	number of colonies on the plate
-:	no typical colonies but presence of background microflora
st:	plate without any colony
d:	doubtful result
ni:	non-isolated colony
PA:	positive agreement
NA:	negative agreement
ND:	negative deviation
PD:	positive deviation
PPNA:	positive presumptive negative agreement
PPND:	positive presumptive negative deviation
O:	oxidase test
w:	weak reaction
NFDM:	non-fat dry milk

2005: initial validation for protocol 1 (double step enrichment)
2009: renewal and extension for protocol 2 (short protocol)
2010: extension for environmental category (protocol 2)
2015: extension for IC & IF (375 g)
2017: renewal
2020: extension for IC & IF with a new protocol (375 g)
2022: extension for pet food and animal feed (375 g)

Results 1 - Double enrichment step protocol

♦ Analyses performed according to the COFRAC accreditation

Appendix 11 - Sample preparation procedure

⁷ Disposable biotargets 96 were used for the validation study

MALDI-TOF

The Direct Transfer (DT) Sample preparation enables to get an identification result for 90%-95% of the bacterial isolates. When no identification is obtained, this procedure should be repeated. If it is still the case, then the users have to run the eDT, and when needed the EXT sample preparation. In some rare cases, a sub-culture on a non selective agar might be required.

Appendix 13 - Inclusivity / exclusivity: raw data using the MALDI Biotyper of Bruker

*Matching-hint: Salmonella can be only identified on genus

Misidentification

- * : Matching-hint closely related to *Shigella* and not definitely related for the moment
- ** : *Enterobacter gergoviae* and *Pluralibacter gergoviae* are synonyms
- *** : Many strains of *Enterobacter* genus have been recently reclassified, some of them in the *Lelliottia* genus

The comparison of the reference spectra between *Raoutella* spp (n = 24) and *Enterobacter* spp (n = 29) shows a maximal score value of 2.06. A mismatch is possible. However, only a third method can help in commenting this disagreement, as there are quite a numerous reference spectra for these two genus in the MBT Library.

The comparison of the reference spectra between *Kluyvera* spp and *Enterobacter* spp shows a maximal score value of 1.75. A mismatch is unlikely.

The comparison of the reference spectra between *E. coli* (n = 14) and *Shimwellia* (n = 1) shows a maximal score value of 1.65, which correspond to a red score; a mismatch is unlikely.

The comparison of the reference spectra between *Panteoa* (n = 27) and *Citrobacter* (n = 47) shows a maximal score value of 1.84, and many reference spectra are available; a mismatch is unlikely.

The best match between *Pseudomonas* (n = 174) and *Stenotrophomonas* (n = 14) shows a maximal score value of maximal 1.58, which correspond to a red score; a mismatch is unlikely.
