Preamble

Validation protocol :

EN ISO 16140-2 (September 2016): Food chain microbiology. Validation of methods - Part 2: Protocol for the validation of alternative (commercial) methods compared with a reference method.

Supplemented by the "Specific requirements of the Food Microbiology Technical Office" of the NF VALIDATION mark (PR Revision 7).

Reference method :

EN ISO 11290-1 (May 2017)

Scope :

All human food products (by validation tests on a wide range of foods) and environmental samples (excluding primary production samples).

Certification organism:

AFNOR Certification (<http://nf-validation.afnor.org/>)

1. Introduction

The GENE UP® *Listeria monocytogenes* 2 (LMO2) method was certified by AFNOR Certification according to the ISO 16140-2 standard under the certification number BIO 12/40-11/16.

The validation stages, the expert laboratory and the standards used during the studies are presented in the table below.

Date	Purpose	Mix PCR and software	Expert Laboratory	Standards
November 2016	<u>Initial validation</u> in Meat products and dairy products (general protocol)	Multi doses and software 1.1		<ul style="list-style-type: none">- ISO 16140-2:2016 (preliminary study)- AFNOR requirements : v5.1 (November 2015)- ISO 11290-1/A1 (2005)
January 2017	First extension in seafood products, vegetal products, composite food (general protocol) and environmental samples with general and specific protocol	Multi doses and software 1.1	ISHA	<ul style="list-style-type: none">- ISO 16140-2:2016 (preliminary study)- AFNOR requirements : v5.1 (November 2015)- ISO 11290-1/A1 (2005)
July 2017	<u>Modification for use of software version 2.0</u>	Multi doses and software 2.0		<ul style="list-style-type: none">- AFNOR requirements : v6 (mai 2017)
December 2018	Second extension for the new kit PCR	Unit dose and software 3.0		<ul style="list-style-type: none">- AFNOR requirements : v6 (mai 2017)
May 2020	<u>Modification for use of software version 3.1</u>	Unit dose and software 3.1	BioMérieux	<ul style="list-style-type: none">- Minor modification
October 2020	<u>Renewal study</u>	Unit dose and software 3.1	INOVALYS	<ul style="list-style-type: none">- ISO 16140-2:2016- AFNOR requirements : v6- ISO 11290-1 (2017)
October 2021	<u>Extension study : new protocol for dairy products</u>	Unit dose and software 3.1	INOVALYS	<ul style="list-style-type: none">- ISO 16140-2:2016- AFNOR requirements : PR7- ISO 11290-1 (2017)

2. Method protocols

2.1. Alternative method

Principle of the method :

The GENE-UP® *L. monocytogenes* 2 kit is to be used with compatible PCR strip tubes in the GENE-UP Thermocycler. Each reaction vial in the GENE-UP *L. monocytogenes* 2 kit contains all of the necessary components for PCR, including sample-specific primers and probes and an internal amplification control.

The GENE-UP Thermocycler detects fluorescence at several wavelengths (channels) to allow multi-target detection in the same reaction vessel. The fluorescent signal from a sample is recorded in channel 640, while the fluorescent signal for an internal amplification control is recorded in channel 705. The software automatically interprets the results for both fluorescence channel and determines the sample result based on the outcome of the control.

Both the assay for the sample and the internal amplification control utilize dual Fluorescence Resonance Energy Transfer (FRET) hybridization probes. These probes consist of two different short oligonucleotides that hybridize to an internal sequence of the amplified fragment during the annealing phase of the reaction cycle. The first probe for the sample assay is labeled at the 3' end with fluorescein; the second probe is labeled at the 5' end with LC Red 640. FRET occurs only after the two probes come in close proximity from hybridizing to the template DNA.

The resulting fluorescent signal from the FRET interaction, which forms a real-time amplification curve, is how the amplified target is detected by the GENE-UP Thermocycler. After the PCR cycling program finishes, the PCR product(s) are melted to determine the presence of the target DNA. The software interprets data for each sample and gives a positive, negative, or inhibited result.

The internal amplification control, contained in the reconstitution buffer, validates that the reaction conditions are sustainable for PCR to take place, thus validating a negative outcome for the sample. The internal amplification control is amplified by the same primer set but uses a different set of hybridization FRET probes to allow detection in the 705 channel.

PCR results interpretation :

A sample is declared negative if no melt peak is detected or if the peak is outside of a defined range of TM values, or if the height of the peak is lower than a negative threshold value.

A sample is declared positive if the melt peak is inside the TM range of values and if the peak is higher than the previous threshold.

Alternative method protocol :

Protocols available and associated categories are described in table 1.

Table 1 : Protocols

Category	Test	Dilution	Enrichment	Protocol
Meat products	25 g	1/10	LPT broth 22 - 28 h at 37 ± 1°C	①
Dairy products	25 g	1/10	LPT broth 22 - 28 h at 37 ± 1°C	①
	25 g	1/10	LX broth 22 - 28 h at 37 ± 1°C	③
Seafood products	25 g	1/10	LPT broth 22 - 28 h at 37 ± 1°C	①
Vegetal products	25 g	1/10	LPT broth 22 - 28 h at 37 ± 1°C	①
Composite foods	25 g	1/10	LPT broth 22 - 28 h at 37 ± 1°C	①
Environmental samples	25 g or sample device	1/10 or 10 mL or 100 mL	LPT broth 22 - 28 h at 37 ± 1°C	① Except surface samples
			LPT broth 18 - 24 h at 37 ± 1°C	② Surface samples

The enrichment is followed by a lysis step on 20 µL enrichment and a detection step in the GENE-UP thermocycler on 10µL lysate.

Results are interpreted and shown in the GENE-UP Routine software.

Presumptive positive results are confirmed by streaking 10 µL of the enriched LPT or LX broth on a chromogenic agar according to the definition of ISO 11290 (Ottaviani Agosti formulation type) or forming part of an ISO 16140-2 certified method, followed by a single reading or biochemical tests.

Protocol of the alternative method, including the confirmation steps, is shown in [appendix 1](#).

It is possible to store the enrichment broth and the lysates for 72h at 5°C ± 3°C.

Restriction :

There is no restriction.

2.2. Reference method

In the previous validations, the reference method used was the one described in the standard ISO 11290-1/A1 (2005), "Horizontal method for the detection and enumeration of *Listeria monocytogenes* - Part 1: Detection method".

For the last extension study, the reference method was the ISO 11290-1 (May 2017) : Microbiology of the food chain - Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria spp.* - Part 1: Detection method".

The workflow of the method is set out in [appendix 2](#).

2.3. Study design

The study is an unpaired design as the reference and the alternative methods have different enrichment procedures.

3. Initial validation and extension/renewal studies : results

3.1. Method comparison study

The study was conducted on a variety of samples and strains representative of agri-food products. This is not an exhaustive list of the different matrixes included in the scope.

3.1.1. Sensitivity study

The relative sensitivity (SE) is the ability of the alternative method to detect the analyte when it is detected by the reference method.

3.1.1.1. Number and nature of samples

Combining the different studies, 572 samples were analysed, 247 positive samples and 325 negative samples.

The repartition of samples per category and type is presented in table 2.

Table 2 : Number and nature of samples

Category	Type	Protocol	Negative samples	Positive samples	Total
Meat products	a Raw products (including deep-frozen, fresh, seasoned)	①	28	13	41
	b Ready-to-eat and processed meat products		14	11	25

	b Ready-to-reheat foods		10	12	22
	c Pastries, egg products		12	10	22
	Total		35	33	68
Environmental samples	a Process waters	①	10	15	25
	b Dusts and residues		14	7	21
	c Sponges and swabs	②	41	30	71
	Total		65	52	117
Total all categories				325	247
Total protocol ①				251	186
Total protocol ②				41	30
Total protocol ③				33	31
					64

3.1.1.2. Artificial contamination of samples

Artificial contaminations were performed using the seeding protocol. No more than six positive results were obtained using the same strain.

Considering all the categories of the application scope, 247 samples gave a positive result by at least one of the method and 44.1 % of them were naturally contaminated.

Table 3 : Repartition of the positive samples

Naturally contaminated	Artificially contaminated			Total	
	Seeding				
	≤3	3<x ≤10	>10		
109	118	20	0	247	
44.1%	47.8%	8.1 %	0%	100%	

3.1.1.3. Protocols applied during the study

During the validation study, only the minimal incubation time of the broth of the alternative method was tested, namely: 22 hours for protocols ① and ③, and 18 hours for protocol ②.

All samples of the alternative method were confirmed by direct streaking of 10 µL of the enriched LPT broth on an ALOA petri dish.

Typical colonies were confirmed by :

- the observation of the presence of typical colonies,
- the tests of the EN ISO 11290-1/A1 method including the purification step,
- a Rapidec L.mono test from an isolated colony,
- a Fast Rhamnose test from an isolated colony,
- an API Listeria gallery from an isolated colony.

In case of absence of typical colonies after a direct streaking from the enriched LPT broth, a subculture in 10 mL of Fraser broth was performed from 0.1 mL of the enriched LPT broth. This broth was incubated for 22 h at 37±1°C, then streaked on ALOA and PALCAM. Typical colonies were confirmed by the tests described above.

For samples found negative with the Gene-UP Listeria monocytogenes 2 test, a subculture of 0.1 ml of the LPT broth was performed into 10 mL of Fraser broth incubated for 48 hours and then streaked onto an ALOA Petri dish to apply the extended confirmation protocol of the ISO 16140-2 standard for negative samples.

A storage of the DNA extracts for 72 h at 5±3°C was performed for all samples.

A storage of the enriched LPT broth for 72 h at 5±3°C was also performed for positive and discordant results. Results were confirmed by streaking on ALOA agar media, followed by a rapid test. In case of discordance in the confirmation result with the results obtained in first analysis, all kinds of confirmation of the alternative method were applied.

3.1.1.4. Results

Raw data are shown in appendix 4.

The results are given in the following table 4.

Table 4 : Summary of results obtained with reference method and alternative method
 (PA : positive agreement, NA : negative agreement, PD : positive deviation, ND : negative deviation, PP : positive presumptive non confirmed)

Category	PA	NA	PD	ND	PPNA*	PPND*	TOTAL

A summary of the results is given in Table 6.

Table 6 : Summary of results

	EN ISO 16140-2 Formula	All categories
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100 \%$	85,4%
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100 \%$	84,2%
Relative trueness (RT)	$RT = \frac{(PA + NA)}{N} \times 100 \%$	86,9%
False positive ratio for the alternative method (FPR)	$FPR = \frac{FP}{NA} \times 100 \%$	3,4%

3.1.1.6. Analysis of discordant results

Positive deviations

A positive result is obtained by the alternative method whereas a negative result is obtained by the reference method.

Positive deviations are listed in Table 7.

39 positive deviations were observed, 14 on naturally contaminated samples and 25 on artificially samples.

Due to the difference of sampling between both methods, no cell of *L. monocytogenes* may have been taken in the sampling for the reference method.

Negative deviations

A positive result is obtained by the reference method whereas a negative result is obtained by the alternative method.

Negative deviations are listed in Table 8.

36 negative deviations were observed, 15 on naturally contaminated samples and 21 on artificially contaminated samples.

For 35 samples, the presence of *Listeria monocytogenes* strains was not confirmed. Due to the difference of sampling between both methods, and the use of contaminated samples with low levels of contamination, no cell of *Listeria monocytogenes* may have been present in the sampling of the alternative method.

For 1 sample: GL297 (composite foods), a negative result is obtained by the alternative method. However the confirmation protocols allowed finding typical colonies which were confirmed as *Listeria monocytogenes*.

For this sample, it is probable that the enrichment did not allow to reach the threshold of the GENE-UP method.

11 samples found positive with the Gene-UP *Listeria monocytogenes* 2 method were not confirmed.

9 samples showed an absence of CP but the presence of a MP. These samples may correspond to a false detection by the software. The curves obtained for such samples are displayed in appendices 5a and 5b. For one sample (GL206, chive), a clear positive signal was obtained but it was not possible to confirm the presence of *L. monocytogenes* in the LPT broth.

All the DNA lysates from these eleven samples were re-analyzed. They became negative (CP and MP equal to 0.00), except samples GL48 and GL206 which remained positive.

The analysis of discordant results according to the EN ISO 16140-2:2016 is presented in Table 9.

Table 7 : Positive deviations

The observed values ((ND+PPND) – PD) are below the acceptability limit for each category and for all categories.

3.1.1.7. Confirmations

Confirmations were carried out by streaking 10 µL of the enriched broth on an ALOA petri dish.

For samples GL5, GL12, GL21 and GL23, the result of the confirmation using a RAPIDEC L. mono test was *Listeria ivanovii* whereas all other confirmations indicated the presence of *Listeria monocytogenes*. This result was probably due to a low quantity of biomass for the realization of the test. A new test after a streaking of a typical colony on an ALOA agar media gave the result *Listeria monocytogenes*.

3 samples were confirmed positive after the application of the extended confirmation procedure: GL228, GL356 and 1.

For four samples: GL297 and GL318 (composite foods) and GL228 and GL356 (vegetal products), a negative result is obtained by the alternative method. However the confirmation protocols allowed finding typical colonies which were confirmed as *Listeria monocytogenes*.

For these samples, it is probable that the enrichment did not allow to reach the threshold of the GENE-UP method.

It's important to note that the result of the reference method for samples GL228, GL318 and GL356 showed also an absence of *Listeria monocytogenes*.

3.1.1.8. Study of storage at 5°C

Study of storage of the DNA extracts

A stability study of the DNA lysates stored at 5±3°C for 72 hours was performed on all samples. After storage, the lysates were re-analyzed.

8 modifications appeared between the analysis just after the lysis step and after three days of storage: they concern false positive results that became negative after three days of storage for 7 samples: GL425 (seafood), GL275, GL276, GL283 (composite foods), GL481, GL545 and GL562 (environment).

Sample GL356 (vegetables), found positive after storage of the DNA, was confirmed positive after the extended confirmation procedure only (positive deviation).

Study of storage of the enriched broths

A stability study of the enriched LPT broths stored at 5±3°C for 72 hours was performed on all positive and discordant samples. After storage, the broths were re-analyzed and confirmed with an isolation on ALOA and PALCAM agar media (results in [appendix 4](#) and analysis of discordant results in table 10).

7 modifications appeared, they are presented in Table 10.

6 false positive results became negative after three days of storage and one sample, found positive after enrichment and after storage of the LPT broth for 72 hours at 2-8°C, was unable to be confirmed after the storage of the LPT broth, even after a subculture of the LPT broth in Fraser broth.

Table 10 : Modifications observed after enriched broth and lysate storage for 72h at 5°C

	Total	9	6	0	-3	3
	Total all categories	39	36	2	-1	7
Total protocol ①		33	32	2	1	6
Total protocol ②		1	2	0	1	3
Total protocol ③		5	2	0	-3	3

The observed values ((ND+PPND) – PD) are below the acceptability limit for each category and for all categories. The alternative method produces results comparable to the reference method. These results did not modify the conclusion for the conservation of the broths.

3.1.1.9. Inhibition

One inhibition was observed with sample GL270 (noodles chicken vegetables). The workflow to remove the inhibition has been applied successfully.

3.1.2. Relative level of detection

The relative level of detection (RLOD) is defined as the level of detection at P = 0.50 (LOD₅₀) of the alternative (proprietary) method divided by the level of detection at P = 0.50 (LOD₅₀) of the reference method.

The RLOD is defined as the ratio of the alternative and the reference method :

$$\text{RLOD} = \frac{\text{LOD}_{\text{alt}}}{\text{LOD}_{\text{ref}}}$$

3.1.2.1. Experimental design

8 matrix-strain couples were studied in parallel by both methods. For each category of the scope, one relevant type of food product is selected. Three levels of contamination per type were prepared consisting of a negative control level, a low level, and a higher level. Only one strain of the target analyte is used to contaminate the low and the high level.

The negative control level shall not produce positive results. Five replicates are tested for this level.

The low level shall be the theoretical detection level, providing fractional recovery results. Twenty replicates are tested for this level.

The higher level shall be just above the theoretical detection level. Five replicates are tested for this level.

Food products were contaminated using the seeding protocol. Bulk contaminations were performed on the matrices for the different levels of contamination, then the matrices were stored at 5±3°C for two or three days before analysis. Samples were then analyzed by the reference and the alternative method.

For the alternative method, only the minimal incubation time of the broth of the alternative method was tested, namely 22 hours for protocols ① and ③, and 18 hours for the protocol ②. Results were obtained using the Gene-UP Routine software version 1.1 (previous validartions) or 3.1 (extension study).

Simultaneously, a total viable count was performed on a portion of non-contaminated matrix to estimate the concentration of mesophilic aerobic flora. A detection of *Listeria monocytogenes* using the reference method was also performed to check the absence of the target analyte in the matrix.

Table 12 details the couples matrix-strain tested.

Table 12 : couples matrix-strain used for the determination of the RLOD of the method

Category	Matrix type	Strain	Code	Strain origin	Protocol
Meat products	Pork rillettes	<i>Listeria monocytogenes</i> 1/2c	LIS.4.33	Minced meat	①
Dairy products	Raw milk	<i>Listeria monocytogenes</i> 1/2b	LIS.4.32	Raw milk	①
Dairy products	Raw cow milk	<i>Listeria monocytogenes</i> 2a	AFNL102	Milk	③
Seafood products	Salmon offcuts	<i>Listeria monocytogenes</i> 4b	LIS.4.50	Swab on salmon	①
Vegetal products	Precooked vegetables	<i>Listeria monocytogenes</i> 1/2a	LIS.4.10	Salad	①
Composite foods	Mixed salad	<i>Listeria monocytogenes</i> 1/2c	LIS.4.35	Vegetables sandwich	①
Environmental samples	Swab on a surface	<i>Listeria monocytogenes</i> 3a	LIS.4.44	Surface control	②
Environmental samples	Process water	<i>Listeria monocytogenes</i> 1/2a	LIS.4.16	Surface control drainage point	①

3.1.2.2. Results and calculation of the RLODs

Raw results are shown in [appendix 5](#).

The RLODs calculations were performed according to the standard ISO 16140-2: 2016 using the Excel spreadsheet available for download at <http://standards.iso.org/iso/16140>. Values of the RLODs are presented in table 13.

Table 13 : RLODs values for the six categories

(RLOD: the estimated relative level of detection value, RLODU: the upper limit of the 95% confidence interval for RLOD, RLODL: the lower limit of the 95% confidence interval for RLOD, $b=\ln(RLOD)$: logarithm of the RLOD value, $sd(b)$: standard deviation of b, z-Test statistic: absolute value of the test statistic of the z-Test with the null hypothesis $H_0: b=0$, p-value: p-value of the z-Test)

Matrix	Protocol	AL	RLOD	RLODL	RLODU	$b=\ln(RLOD)$	$sd(b)$	z-Test statistic	p-value
Pork rillettes	①	2.5	0.678	0.275	1.668	-0.389	0.450	0.864	1.612
Raw milk	①		1.313	0.527	3.271	0.272	0.457	0.596	0.551
Raw milk	③		0.401	0.183	0.875	-0.914	0.391	2.341	1.981
Salmon offcuts	①		1.533	0.686	3.424	0.427	0.402	1.063	0.288
Mix of precooked vegetables	①		0.565	0.241	1.322	-0.572	0.426	1.344	1.821
Mixed salad	①		0.667	0.320	1.390	-0.404	0.367	1.103	1.730
Swab on a surface	②		0.756	0.291	1.969	-0.279	0.478	0.584	1.441
Process water	①		1.146	0.498	2.636	0.136	0.417	0.327	0.744
Combined			0.816	0.620	1.074	-0.203	0.137	1.478	1.861

The RLODs values are below the acceptability limit set at 2.5, meaning that alternative and reference methods show similar LODs values for the detection of *Listeria monocytogenes* in the tested categories.

3.1.2.3. Calculation of the LOD_{50%}

The LOD_{50%} calculations according to the Wilrich & Wilrich POD-LOD calculation program – version 10, 2021-03-02 test are given in table 14.

Table 14 : LOD₅₀ results

Category	Strain/matrix pair	Protocol	Level of detection at 50% (CFU/sample size) according to Wilrich & Wilrich	
			Reference method	Alternative method
Meat products	Pork rillettes/ <i>Listeria monocytogenes</i> 1/2c	①	0,90 [0,49-1,68]	0,67 [0,38-1,19]

	Process water/ <i>Listeria monocytogenes</i> 1/2a	①	3,81 [1,85-7,86]	2,91 [1,51-5,63]
Combined			1,02 [0,83-1,25]	0,82 [0,67-1,00]

3.1.3. Inclusivity / Exclusivity

Inclusivity is the capacity of the alternative method to detect the target analyte from a wide range of strains. Exclusivity is the absence of interferences by an appropriate range of untargeted strains from the alternative method.

3.1.3.1. Tests protocols

Initial validation study

Fifty target strains and thirty non-target strains were analyzed by the alternative method.

For target strains, 225 mL of LPT broth were inoculated with 10 to 50 cells of *Listeria monocytogenes*. The complete protocol of the alternative method was then applied after an incubation at the minimum enrichment time of the alternative method (22 h). Results were obtained using the Gene-UP Routine software version 1.0.

Positive results were confirmed by streaking of the enriched broth on ALOA agar media, incubated for 24 to 48 h at 37±1°C.

For non-target strains, cells were cultivated first overnight in a non-selective broth (BHI) at 10⁵ CFU/mL. The protocol of the alternative method was then applied.

2021 Extension study

The new protocol ③ of this extension study considered as more selective than the protocol ①, it was proposed to proceed to a new inclusivity study only.

Fifty target strains were analyzed by the alternative method with the new protocol ③.
225 mL of LX broth were inoculated with 10 to 100 cells of *Listeria monocytogenes*. The complete protocol of the alternative method was then applied after an incubation at the minimum enrichment time of the alternative method (22 h).

Positive results were confirmed by streaking of the enriched broth on ALOA agar media, incubated for 24 to 48 h at 37±1°C.

3.1.3.2. Results

The raw data are shown in [appendix 6](#).

All target strains were detected by the alternative method.

None of the non-target strains showed a cross reaction with the alternative method.

3.1.4. Praticability

The practicability of the alternative method was informed according to the criteria defined by the Technical Committee.

1. Storage conditions, shelf-life and modalities of utilization after first use

The GENE-UP kits are stored at room temperature (15-25°C) and have not to be refrigerated. After opening a kit, the pouches have to be correctly sealed and undamaged. If not, they have not to be used.

Once pouches are opened, freeze-dried pellets should be reconstituted and used within 2 months. Freeze-dried pellets should be stored in original sealed pouch (with lab adhesive or bag clip). Once freeze-dried pellets are reconstituted, testing on the GENE-UP Thermocycler should be initiated as soon as possible. Storage conditions for vials are the following: 2 hours at ambient temperature, 2 days at 2 – 8°C, 8 days at -20°C.

2. Time-to-result

Negative results are obtained in one day.

Positive results are obtained in two to three days.

3. Common step with the reference method

The alternative method has no common step with the reference method.

3.2. Extension study results for the unit dose kit

An extension study was carried out on December 2018 for a new format of the kit.

- Summary of the difference between the two PCR assays :

	Multi-Dose	Unit-Dose
Name	GENE-UP® <i>L. monocytogenes</i>	GENE-UP® <i>L. monocytogenes</i> 2
Kit reference	414058	423107
Kit insert reference	43-04322	050568
Mix PCR	Freeze dried reagent for 8 reactions - Reconstitution with 45 µL of buffer, then distribution of 5µL in each PCR tube	Freeze dried reagent for 1 reaction in each PCR tube
Volume of lysate	5 µl	10 µl
Software version	2.0	3.0 and following

- Interpretation of both software versions :

PCR result determination with software 2.0

A sample is declared negative if no melt peak is detected or if the peak is outside of a defined range of TM values, or if the height of the peak is lower than a negative threshold value.

A sample is declared positive if the melt peak is inside the TM range of values and if the peak is higher than the negative threshold.

PCR result determination with software 3.0

A sample is declared negative if no melt peak is detected or if the peak is outside of a defined range of TM values, or if the height of the peak is lower than a negative threshold value. The negative threshold is the same as in version 2.0.

A sample is declared positive if the melt peak is inside the TM range of values and if the peak is higher than the negative threshold, or if the curve crosses a new positive threshold. This positive threshold is the main difference between version 2.0 and 3.0.

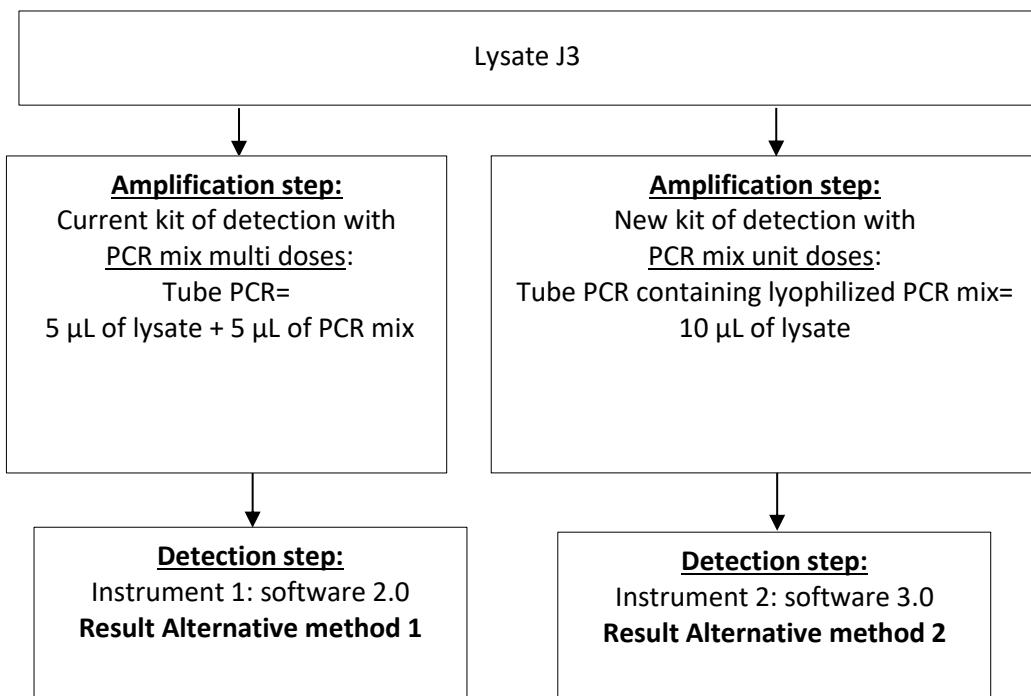

In version 3.0, the threshold for the internal control has been increased to better detect inhibitions.

Version 3.0, also allows a specific access to individual assays, which provides more flexibility.

3.2.1. Analysis

For the GENE-UP® LMO method, during the initial validation the lysates were analyzed at the end of the incubation time, then after storage for 72 hours at 2-8°C and they were then stored at -25±6°C.

As only the PCR step is concerned by the changes, the comparison study was performed using the lysates J3 as described below.

All lysates generated during the validation studies (508 lysates) were tested with the multi dose and the unit dose kits using the software 2.0 and 3.0 respectively. The results of the unit dose format/software 3.0 were compared to the results of the multi doses format/ software version 2.0.

As agreed by the AFNOR Technical Committee, only the lysates from the sensitivity study were retested.

3.2.2. Results

The results of the comparison between both kits using respectively the software 2.0 and 3.0, are shown in [appendix 7](#).

Difference observed between the two protocols are presented in the table 15.

Table 15. Difference observed between the multi dose and the unit dose kits using respectively the software 2.0 and 3.0

SN	Sample	Previous validation study			1) AM: GENE UP Current kit/software 2.0			2) AM: GENE UP New kit/software 3.0			Concordance between 1) and 2)
		CP	MP	Result	CP	MP	Result	CP	MP	Results	
GL141	Raw chicken cutlet	23,64	64,76	+	0.00/25.00/24.56	0.00/64.91/64.78	-/+/-	27.74	64.47	+	#/=
GL108	Neuchâtel cheese (raw milk)	30,60	65,37	+	0.00/31.25/31.84	0.00/65.42/65.39	-/+/-	27.90	64.69	+	#/=

All samples called “negative” gave negative results after analysis with both kits.

All samples called “positive” gave also positive results after analysis with both kits except for two of them.

Samples GL108 and GL141, found positive and confirmed positive during the initial validation study, were found positive with the new PCR assay and negative with the current PCR assay. These two samples were retested two times with the current kit and gave positives results. As attested by the high CP values, a concentration of *Listeria monocytogenes* close to the threshold of the tests may explain the difference between the two assays.

For the sample called “positives” some slight differences in the TM values were observed between the two kits tested without change in the test interpretation.

Six inhibitions were observed among the 508 PCR reactions performed (two with the current kit, GL70 and GL85, and four with the new kit, GL4, GL28, GL48 and GL70). These inhibitions are presented in table 16.

Table 16. Inhibitions observed with the multi dose and the unit dose kits using respectively the software 2.0 and 3.0 (I: inhibition ; (1/3): dilution 1/3 of the lysate).

SN	Sample	Previous validation study			1) AM: GENE UP Current kit/software 2.0			2) AM: GENE UP New kit/software 3.0			Concordance between 1) and 2)
		CP	MP	Result	CP	MP	Result	CP	MP	Results	
GL28	Raw boneless pork tenderloin	0,00	0,00	-	0,00	0,00	-	I/0,00	I/0,00	I/- (1/3)	=
GL70	Goat cheese Cœur de chèvre (raw milk)	0,00	0,00	-	I/0,00	I/0,00	I/-(1/3)	I/0,00	I/0,00	I/- (1/3)	=
GL85	Organic Cabécou cheese 1 (raw milk)	0,00	0,00	-	I/0,00	I/0,00	I/- (1/3)	0,00	0,00	-	=
GL4	Chinese cooked duck	25,63	61,99	+	25,96	62,03	+	I/26,77	I/61,87	I/+ (1/3)	=
GL48	Raw chicken cutlet	30,62	65,26	+	31,17	64,75	+	I/32,85	I/64,56	I/+ (1/3)	=

As described by the supplier, the lysates were diluted at 1/3 and analyzed again. Finally the analysis of the diluted lysates gave the results expected with the two tested kits. The negative samples remained negative and the positive samples remained positive.

3.2.3. Conclusion

In conclusion, among the 508 lysates tested only two differences between the 2 kit formats and the software 2.0 and 3.0, were observed. The observed values ((ND+PPND) – PD) are the same as during the previous validation study and are below the acceptability limit for each category and for all categories.

The performance obtained during the extension study are not modified and the results allowed to conclude to equivalency of the unit doses format associated to software version 3.0 with the multi doses PCR format associated to software version 2.0.

3.3. Inter-laboratory study

The purpose of the interlaboratory studies is to determine the difference in sensitivity between the reference method and the alternative method when tests are performed by different collaborators using identical samples (reproducibility conditions).

3.3.1. Inter-laboratory study organization

A first session was realized in April 2016. Its results were presented at the Technical Board meetings of June and September 2016. After removal of 6 data sets as explained below, less than 10 data sets were available for the statistical interpretation of the results.

An additional interlaboratory study, including 4 collaborators was realized in September 2016 in the same conditions.

The two studies were combined for the final interpretation.

3.3.1.1. Collaborators

The first interlaboratory study was realized by the expert laboratory and fifteen collaborators coming from fourteen different organizations.

The second interlaboratory study was realized by the expert laboratory and four collaborators coming from four different organizations.

Each laboratory received the instructions relative to the organization of the study a week before its beginning.

3.3.1.2. Matrix and strain of *Listeria spp.*

A full-cream goat milk cottage cheese was used as test matrix for the two studies. Its ingredients are the following: pasteurized full-cream goat milk, milk enzymes, rennet. Its fat content is 8.4%. It was contaminated by a strain of *Listeria monocytogenes* 1/2 b, isolated from a raw milk (LIS.4.67).

The absence of *Listeria monocytogenes* in the matrix before contamination was checked using the reference method.

3.3.1.3. Matrix Stability of the strain in the test matrix

The stability of the strain in the matrix was evaluated for 4 days at $5\pm3^{\circ}\text{C}$ before the interlaboratory study. Samples for enumeration were contaminated at a level close to 100 CFU/g. Samples for detection were inoculated at a level from 1 to 3 CFU/25 g. Results of the analyses are presented in table 17. No significant variation of the *L. monocytogenes* count was observed until Day 3.

Table 17 : determination of the stability of the strain of *L. monocytogenes*

Day	Enumeration CFU/g	Alternative method	Reference method
D0	160	Presence in 25 g	Presence in 25 g
D1	200	Presence in 25 g	Presence in 25 g
D2	140	Presence in 25 g	Presence in 25 g
D3	210	Presence in 25 g	Presence in 25 g

3.3.1.4. Preparation and contamination of the sample

The matrix was inoculated with the target strain suspension to obtain 3 contamination levels:

- L0 : 0 cell in 25 g,
- L1 : 0.7 – 1 cells in 25 g,
- L2 : 10 cells in 25 g.

Twenty-five grams of matrix were distributed in sterile bags. Each bag was individually contaminated and homogenized. Eight samples per level, per collaborator and per method were prepared. Each collaborator received 48 samples to analyze, one sample to perform the total viable count (TVC) and one water sample containing a temperature probe.

The results of the TVC, the target levels and the real levels of contamination are presented in table 18.

Table 18 : target level, real level and endogenous flora of the matrix

Matrix	TVC (CFU/g)	Target level (cells/25 g)	Real level (cells/25 g)	Confidence interval
Cottage cheese	$3,0 \cdot 10^6$	0	/	/
		0.7 – 1	1.9	[1.5 ; 2.4]
		10	9.2	[7.2 ; 11.4]

3.3.1.5. Labelling of the samples

Labelling of the bags was realized as follows:

- a code to identify the laboratory: from A to O.
- and a code to identify each sample, only known by the expert laboratory.

The samples and the temperature control vials (water sample with a temperature probe) were stored at $5 \pm 3^\circ\text{C}$ before shipping.

3.3.1.6. Shipping and receipt of the samples, analyses by the collaborators

The samples were shipped in a coolbox.

The control temperature was recorded upon receipt of the package and the temperature probe sent to the expert laboratory.

The samples had to be analyzed one or two days after the shipping.

The expert laboratory concurrently analyzed a set of samples under the same conditions with both methods.

For the first study, it is important to note that two series of analyses were realized by the collaborators for the detection with the alternative method:

- one at the following of the lysis step for the regular workflow of the method but with a detection kit which should not have been used after an error in the delivery of the kits,
- the other after storage of the DNA a few days at -20°C with a kit capable of being used.

For all collaborators except one, samples which were presumed positive not confirmed or inhibited with the first detection kit were found negative with the second detection kit.

Only collaborator C obtained four samples inhibited with the second detection kit, when it had only one sample presumed positive not confirmed with the first detection kit. This laboratory did

not preserve lysates and was not thus able to re-test the inhibited samples. That's why the results of this collaborator are not kept in the statistical analysis, because no answer is obtained for four samples. Results of this collaborator are presented only in appendices.

Only analyses performed with the second detection kit (the valid kit) were taken into account for the compilation of the data.

3.3.2. Results

3.3.2.1. Shipping Temperature and state of the samples at receipt

The temperature readings upon reception and the state of the samples are shown in table 19.

Table 19 : temperature and state of the samples at reception (/: data unable to be gathered)

Collaborator	Date and time of receipt	Temperature (°C) determined by the collaborator	Mean temperature (°C) during the shipping given by the probe	State of the samples	Date of analysis
A	04/26/2016 at 11:30	3.8	2.4	Correct	04/26/2016
B	04/26/2016 at 12:30	2.8	/	Correct	04/27/2016
C	04/26/2016 at 11:45	3.6	2.0	Correct	04/26/2016
D	04/26/2016 at 11:35	5.2	2.5	Correct	04/27/2016
E	04/26/2016 at 10:05	2.6	/	Correct	04/26/2016
F	04/26/2016 at 12:30	7.3	/	Correct	04/27/2016
G	04/26/2016 at 11:00	6.6	4.8	Correct	04/26/2016
H	04/27/2016 at 10:30	3.0	2.9	Correct	04/27/2016
I	04/27/2016 at 10:00	6.5	2.0	Correct	04/28/2016
J	04/26/2016 at 09:35	4.0	3.9	Correct	04/26/2016
K	04/26/2016 at 07:30	2.9	3.7	2 samples leaky	/
L	04/26/2016 at 11:15	4.0	3.5	Correct	04/26/2016
M	04/26/2016 at 10:00	2.9	4.9	Correct	04/26/2016
N	04/26/2016 at 10:20	2.8	1.4	Correct	04/26/2016
O	04/26/2016 at 11:35	5.3	2.5	Correct	04/27/2016
P	06/09/2016 at 11:00	7.8	6.1	Correct	07/09/2016
Q	06/09/2016 at 10:30	2.6	1.9	Correct	06/09/2016
R	06/09/2016 at 11:00	5.0	2.5	Correct	06/09/2016
S	06/09/2016 at 12:00	1.5	-0.8	Correct	07/09/2016

- First interlaboratory study**

Only laboratory K didn't receive the sample in adequate conditions: two samples were leaky. This collaborator did not thus realize the analyses. All other laboratories received the samples in appropriate conditions.

Temperatures during the shipping and upon receipt were correct for all laboratories.

Collaborator I realized the analyses (alternative and reference method) the 28th of April 2016, so three days after shipping, because of a late delivery of the reagents of the methods.

The stability of the strain in the matrix was tested for four days (from D0 to D3) by the expert laboratory and was correct. Moreover the samples of this collaborator were kept cold after reception. The request from the expert laboratory to keep the results of this collaborator in the final data was not accepted by the Technical Board of September 2016.

The results of collaborator I are thus excluded from the final set of data.

The results of collaborator C were already excluded from the statistical analysis of the data because of incomplete results (see § 3.2.1.6).

So fourteen collaborators realized the analyses and the results of only twelve can be taken into account.

- **Second interlaboratory study**

The temperature is found slightly inferior to 0°C for a part of the shipping of the collaborator S package. This may be due to a bad positioning of the thermal probe vial after the packaging, which has probably moved beside a -20°C ice pack. Collaborator S didn't report that the samples were frozen at reception.

Temperatures during the shipping for the other collaborators were correct. Temperatures at reception for all collaborators were correct.

3.3.2.2. Expert laboratory results

The results obtained by the expert laboratory are summarized in table 20.

Raw results are presented in [appendix 9](#).

Table 20 : positive results obtained by expert laboratory by both methods

Interlaboratory study	Contamination level	Alternative method	Reference method
April 2016	L0	0/8	0/8
	L1	3/8	1/8
	L2	8/8	8/8
September 2016	L0	0/8	0/8
	L1	7/8	6/8
	L2	8/8	8/8

The enumeration of the TVC by the expert laboratory gave the result of 4.7×10^8 CFU/g for the first interlaboratory study and 2.3×10^5 CFU/g for the second interlaboratory study.

3.3.2.3. Collaborators results

Raw results are presented in [appendix10](#) and [11](#).

Mesophilic aerobic flora

- **First interlaboratory study**

For the whole laboratories, the total viable count varied between 6.6×10^2 CFU/g and 4.8×10^8 CFU/g.

It is important to note that only two collaborators from the same laboratory found a TVC below 3.0×10^7 CFU/g. This laboratory indicated that the readings of the Petri dishes were performed by technicians not familiar with enumeration techniques which have probably counted only the colonies at the surface of the agar media for the first dilutions of the sample.

The TVCs observed by all other collaborators and by the expert laboratory are between 3.0×10^7 CFU/g and 4.8×10^8 CFU/g.

- **Second interlaboratory study**

For all laboratories, the total viable count varied between 2.0×10^3 CFU/g and 1.4×10^5 CFU/g.

Results of the reference method

Positive results of the collaborators for the reference method are presented in the table 21.

Table 21 : positive results of the reference method for all laboratories

Collaborator	Contamination level		
	L0	L1	L2
A	0 / 8	8 / 8	8 / 8
B	0 / 8	8 / 8	8 / 8
D	0 / 8	8 / 8	8 / 8
E	0 / 8	8 / 8	8 / 8
F	0 / 8	7 / 8	8 / 8
G	0 / 8	8 / 8	8 / 8
H	2 / 8	2 / 8	8 / 8
I	0 / 8	2 / 8	8 / 8
J	0 / 8	4 / 8	8 / 8
L	0 / 8	8 / 8	8 / 8
M	0 / 8	8 / 8	8 / 8
N	0 / 8	8 / 8	8 / 8
O	0 / 8	8 / 8	8 / 8
P	0 / 8	6 / 8	8 / 8
Q	0 / 8	5 / 8	8 / 8
R	0 / 8	7 / 8	8 / 8
S	0 / 8	5 / 8	8 / 8
TOTAL	2 / 136	110 / 136	136 / 136

Results of the alternative method

Positive results of the collaborators for the alternative method are presented in the table 22.

**Table 22 : positive results of the alternative method for all laboratories
(BC / AC: before / after confirmation)**

Collaborator	Contamination level					
	L0		L1		L2	
	BC	AC	BC	AC	BC	AC
A	0 / 8	0 / 8	8 / 8	8 / 8	8 / 8	8 / 8
B	0 / 8	0 / 8	7 / 8	7 / 8	8 / 8	8 / 8
D	0 / 8	0 / 8	8 / 8	8 / 8	8 / 8	8 / 8
E	0 / 8	0 / 8	8 / 8	8 / 8	8 / 8	8 / 8

S	0 / 8	0 / 8	4 / 8	4 / 8	8 / 8	8 / 8
TOTAL	4 / 136	2 / 136	99 / 136	99 / 136	136 / 136	136 / 136

3.3.3. Analysis of the Results

3.3.3.1. Level 0

According to the specific requirements of the Technical Board linked to the standard ISO 16140-2 : 2016, collaborators who obtained more than one positive result at level 0 (confirmed or not) per method must be excluded from the statistical analysis of the results.

This case happens, only during the first interlaboratory study, for:

- collaborator F: 1 presumptive positive result not confirmed and 2 confirmed positive results with the alternative method,
- collaborator H: 2 positive results obtained with the reference method.

3.3.3.2. Level 1

- **First interlaboratory study**

The results shown by the alternative method for all negative deviations observed at level 1 is: CT: 0,00 / MP: 0,00, so an absence of amplification and no detection of a melting peak.

For collaborators B, F and M, the presence of one non-detection at the level 1 could be due to the absence of *Listeria monocytogenes* in the sample analyzed because of the low inoculation level.

For collaborators who obtained a lot of negative results by any method at the level 1, an investigation was performed by the expert laboratory to try to explain deviations between the two methods.

Laboratory G prepared the initial suspensions for the alternative method with refrigerated LPT broths (not warmed to ambient temperature). This way to perform the analyses doesn't meet the requirements of the user guide and can delay the growth of *Listeria monocytogenes*. The proposal of the expert laboratory to exclude this collaborator from the statistical analysis was accepted by the Technical Board.

Laboratory L also used LPT broths not fully warmed to ambient temperature. Investigations showed that the LPT broths were at a 12°C when the initial suspensions were prepared. The Technical Board accepted the proposal of the Expert Laboratory to keep this collaborator for the statistical analysis.

For collaborators H, I and J, numbers of PD and ND were well balanced at level L1 between alternative method and reference method.

- **Second interlaboratory study**

The results shown by the alternative method for all negative deviations observed at level 1 were: CT: 0,00 / MP: 0,00, so an absence of amplification and no detection of a melting peak.

For collaborators P, Q and S, negative samples clearly came from an absence of *Listeria monocytogenes* in the samples as the confirmations were negative. Moreover, considering these three collaborators, positive and negative deviations were well balanced.

For collaborator R, four samples (3 / 8 / 15 / 16) were not detected by the alternative method despite the presence of *Listeria monocytogenes* in the broth.

It seems that the protocol of the alternative method has been correctly applied.

A second analysis of these samples using the lysates stored at -20°C gave three positive results and one negative result.

A summary of these deviations for this collaborator are presented in the table below:

Sample	Gene-UP result / first analysis			Gene-UP result / second analysis from the lysate stored at -20°C			Confirmation
	CP	MP	Result	CP	MP	Result	
3	0.00	0.00	-	27.16	66.69	+	Positive
8	0.00	0.00	-	24.93	66.28	+	Positive
15	0.00	0.00	-	0.00	0.00	-	Positive
16	0.00	0.00	-	25.36	66.26	+	Positive

For three samples out of four, a clear positive result is obtained for the re-test, which indicates the presence of the DNA target in the lysate. That's why, for this collaborator, a manipulation issue during the analysis is suspected, like an error of pipetting.

3.3.3.3. Level 2

For the level 2, all results are consistent with those expected for all collaborators, namely a detection of all samples of the level by the two methods.

3.3.3.4. Conclusion

After having removed collaborators C, F, G, H, I and K from the results of the first interlaboratory study, nine sets of data were available for the statistical analysis.

As the standard ISO 16140-2: 2016 requires at least 10 valid data sets, the data from the second interlaboratory study was taken into account. For this second study, following the decision of the Technical Board of November 2016, the interpretation of the results was performed with the results of the first analysis of collaborator R.

3.3.3.5. Results kept for the statistical interpretation

Results kept are presented in tables below.

Table 23 : positive results of the reference method for laboratories kept for the statistical analysis

Interlaboratory study	Collaborator	Contamination level		
		L0	L1	L2

3.3.4. Interpretation of the results

3.3.4.1. Summary of the results

The global results are presented in the table below.

Table 25 : tests results for the two methods (PA: positive agreement, NA: negative agreement, ND: negative deviation, PD: positive deviation, PP: presumed positive before confirmation)

Level	Alternative method	Reference method	
		Reference method positive (RM+)	Reference method negative (RM-)
L0	Alternative method positive (AM+)	PA = 0	PD = 0
	Alternative method negative (AM-)	ND = 0 including 0 PPND	NA = 104 including 1 PPNA
L1	Alternative method positive (AM+)	PA = 74	PD = 10
	Alternative method negative (AM-)	ND = 17 including 0 PPND	NA = 3 including 0 PPNA
L2	Alternative method positive (AM+)	PA = 104	PD = 0
	Alternative method negative (AM-)	ND = 0 including 0 PPND	NA = 0 including 0 PPNA
L0+L1+L2	Alternative method positive (AM+)	PA = 178	PD = 10
	Alternative method negative (AM-)	ND = 17 including 0 PPND	NA = 107 including 1 PPNA

3.3.4.2. Calculation of sensitivities, relative accuracy and false positive ratio

Based on the three different data sets, the following parameters are calculated:

- Sensitivity for the alternative method: $SE_{alt} = \frac{(PA+PD)}{(PA+ND+PD)} \times 100\%$
- Sensitivity for the reference method: $SE_{ref} = \frac{(PA+ND)}{(PA+ND+PD)} \times 100\%$
- Relative accuracy: $AC = \frac{(PA+NA)}{N} \times 100\%$
- False positive ratio for the alternative method: $FP = \frac{(FP)}{NA} \times 100\%$

where N is the total number of samples (NA + PA + PD + ND) and FP is false positive results.

Results are presented in the table below.

Table 26 : values of sensitivities, relative accuracy and false positive ratio for the three data sets

Data set	Parameter			
	SE_{alt}	SE_{ref}	RT	FPR
Interlaboratory study 10 collaborators	91.7%	95.1%	91.3%	0.9%

3.3.4.3. Determination of the acceptability limit and conclusion

The difference between (ND – PD) for the level where fractional recovery was obtained (L1) is calculated. The observed value found for (ND – PD) shall not be higher than the acceptability limit (AL). The AL is defined as [(ND – PD)_{max}] and calculated per level where fractional recovery was obtained as described below using the following three parameters:

- $(p+)_{ref} = \frac{Px}{Nx}$, where

Px = number of samples with a positive result obtained with the reference method at level x, (L1 or L2) for all laboratories;

Nx = number of samples tested at level x (L1 or L2) with the reference method by all laboratories.

- $(p+)_{alt} = \frac{CPx}{Nx}$, where

CPx = number of samples with a confirmed positive result obtained with the alternative method at level x (L1 or L2) for all laboratories;

Nx = number of samples tested at level x (L1 or L2) with the alternative method by all laboratories.

- $(ND - PD)_{max} = \sqrt{3Nx \times ((p+)_{ref} + (p+)_{alt} - 2((p+)_{ref} \times (p+)_{alt}))}$, where

Nx = the total number of samples tested for level x (L1 or L2) by all laboratories.

The AL is not met when the observed value is higher than the AL. When the AL is not met, investigations should be made (e.g. root cause analysis) in order to provide an explanation of the observed results.

Based on the AL and the additional information, it is decided whether the alternative method is regarded as not fit for purpose. The reasons for acceptance of the alternative method in case the AL is not met shall be stated in the study report.

In this study, fractional positive results are observed at level L1 only. The different parameters obtained by the calculation are detailed in the table below:

Table 27 : values obtained for the determination of the acceptability limit

Parameter	Value
N_x	104
$(p+)_\text{ref}$	0.875
$(p+)_\text{alt}$	0.808
$(ND-PD)_\text{max}$	9.17
$(ND-PD)$	7

The value (ND-PD) is inferior to the AL in all cases, so the requirements of the standard ISO 16140-2 : 2016 are fulfilled.

The performance of the alternative method and the reference method can be considered as equivalent.

3.3.4.4. Determination of the relative level of detection

This evaluation is performed according to the EN ISO 16140-2 : 2016 Excel spreadsheet available at https://standards.iso.org/iso/16140/-2/ed-1/en/RLOD_inter-lab-study_16140-2_AnnexF_ver1_28-06-2017.xls.

As there is limited experience with the interpretation of this approach, the results are used only for information. Results are shown in the table below :

Table 28 : values obtained for the determination of the relative level of detection

Method	LOD50%	LOD95%	RLOD
Reference	0,73 [0,57 ; 0,93]	3,14 [2,46 ; 4,00]	1,1 [0,83 ; 1,45]
Alternative	0,80 [0,63 ; 1,01]	3,44 [2,70 ; 4,37]	

3.4. Conclusion

Overall, the study concerned 508 samples from six categories: meat products, dairy products, seafood products, vegetal products, composite foods and environmental samples.

The sensitivity of the alternative method was 84.3% and the sensitivity of the reference method was 84.3%.

The observed values ((ND+PPND) – PD) were below or equal to the acceptability limit for each category and for all categories.

The RLODs values were below the acceptability limits set at 2.5, meaning that, as stated in ISO 16140-2: 2016, the maximum increase in LOD of the alternative versus the reference method is not considered as relevant in consideration of the fitness for purpose of the method.

The GENE-UP *Listeria monocytogenes* 2 method and the reference method showed similar LODs values for the detection of *Listeria monocytogenes* in the categories tested.

The inclusivity and the exclusivity of the method showed that the method GENE-UP *Listeria monocytogenes* 2 is specific and selective.

The practicability of the method highlighted a method quick and easy to apply.

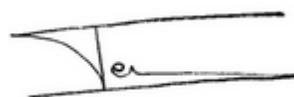

It is possible to store the enrichment broth and the lysates for 72 h at 5°C ± 3°C.

The unit dose kit gave reliable results compared to the multi doses kit.

The interlaboratory study concerned thirteen collaborators for the analysis of a goat milk cottage cheese contaminated with a strain of *Listeria monocytogenes*. The interpretation of the results showed that the performance of the alternative method can be considered as equivalent to the performance of the reference method.

Considering all the categories of the application scope, namely a broad range of foods and environmental samples, the GENE-UP® LMO2 method produces results comparable to the reference method EN ISO 11290-1/A1 according to the standard ISO 16140-2: 2016.

TOURS, the 13th of December 2021

Appendices

APPENDIX 1

ALTERNATIVE METHOD PROTOCOL : multi doses kit

Protocol for a broad range of foods and environmental samples

Enrichment

Food sample and environmental sample except surface samples: (general protocol) :
25 g sample + 225 LPT broth at room temperature in a blender bag.
Incubate for 22 – 28 h at 37±1°C.

Environmental surface samples (specific protocol) :
Sponge or swipe + 100 mL LPT broth at room temperature in a blender bag.
Swab + 10 mL LPT broth at room temperature in a blender bag.
Incubate for 18 – 24 h at 37±1°C.

Lysis

Mix manually the content of the blender bag.
Transfer 20 µL of the enriched broth into a lysis tube.
Place the tube in a bead beater and run it for 5 minutes at a speed above 2 000 rpm.

Final setup for PCR

Reconstitute the PCR reagent according to the manufacturer's recommendations.
A blue color shall be obtained.

Pipet 5 µL of the reagent in a PCR tube.
Using a 10 µL Gene-Up tip, transfer 5 µL of the lysed sample (red color) into the PCR tube.

When sample is added to the PCR reagent, the solution turns purple.

Place a strip cap on each strip tube and seal it.
Spin in a plate centrifuge for 10 seconds.

The plate is now ready to be processed in the Gene-UP instrument and must be started within 15 minutes.

Results

Start the run according to the instructions of the manufacturer.
Read the results with the Gene-UP Routine software.

Confirmation

Confirm all positive results obtained with GENE-UP *Listeria monocytogenes*
Isolate 10 µL of the LPT broth on an O&A agar plate.
Incubate for 24±3 h at 37°C.

The plates can be read between 24 and 48 hours.
The presence of typical colonies confirms a positive result.

An API LIS strip or RAPIDEC Lmono or a Fast Rhamnose essay can be performed directly from an isolated colony

ALTERNATIVE METHOD PROTOCOL : unit dose kit

APPENDIX 4

SENSITIVITY STUDY : RAW DATA

Caption:

◊ : level determined by 3 to 5 enumerations
sp : spiking
se : seeding
nc : naturally contaminated
cm: contamination by mixture
+ / Pos : positive result
- / Neg : negative result
/ : test not realized
Ø : absence of colonies
PA : positive agreement
NA : negative agreement
PD : positive deviation
ND : negative deviation
FN : false negative result
FP : false positive result
PP: presumed positive result before confirmation
A : absence
P : presence
0 / 1 / 2 / 3 / 4 : level of typical flora, from absence to high
Ø / L / M / H : level of annex flora, from absence to high
I : result after re-isolation
(XXX) : number of typical colonies
L.m : Listeria monocytogenes
L.w : Listeria welshimeri
L.in: Listeria innocua
L.iv: Listeria ivanovii
Confirmation : streaking on selective medium + ISO 11290-1 confirmation
Conf. 1 : streaking on selective medium + visual reading
Conf. 2 : streaking on selective medium + API Listeria
Conf. 3 : streaking on selective medium + RAPIDEC L-mono
Conf. 4 : streaking on selective medium + Fast Rhamnose
Conf. 5 : streaking on selective medium + ISO 11290-1 confirmation (case n°1)
chromID L. mono: w=white colonies / b=blue colonies

CP : Number of amplification cycles necessary to obtain a statistically significant fluorescent signal with regard to the background noise
MP : Temperature for which 50% of the double strand DNA is separated

APPENDIX 5

RELATIVE LEVEL OF DETECTION : RAW DATA

Caption: / : test not realized
Ø : absence of colonies
FP : false positive result
A : absence
P : presence
0 / 1 / 2 / 3 / 4 : level of typical flora, from absence to high
Ø / L / M / H : level of annex flora, from absence to high
L.m : Listeria monocytogenes
Confirmation : streaking on selective medium + ISO 11290-1 confirmation
Conf. 1 : streaking on selective medium + visual reading
Conf. 2 : streaking on selective medium + API Listeria
Conf. 3 : streaking on selective medium + RAPIDEC L-mono
Conf. 4 : streaking on selective medium + Fast Rhamnose
Conf. 5 : streaking on selective medium + ISO 11290-1 confirmation (case n°1)
chromID L. mono: w=white colonies / b=blue colonies
