1 INTRODUCTION

The initial validation of the COMPASS *Bacillus cereus* agar method for the enumeration of *Bacillus* of the *cereus* group in food and animal feed was obtained on 5 February 2010 (Certificate No. BKR 23/06 - 02/10) according to ISO 16140 (2003). The certificate was renewed in November 2013. The method was renewed in May 2018 according to ISO 16140-2 (2016).

In 2019, an extension study of the COMPASS *Bacillus cereus* Agar method was carried out for a second protocol with the addition of egg yolk to the basic agar formulation (COMPASS *Bacillus Plus* Agar) with an incubation time reduced to 21 h. This extension concerns food and feed products.

2 METHODS DESCRIPTION

2.1 Alternative method

2.1.1 Principle

COMPASS *Bacillus cereus* Agar is a chromogenic agar which allows the enumeration of vegetative cells and spores belonging to the *Bacillus cereus* group. The chromogenic substrate is hydrolysed by species belonging to the *Bacillus cereus* group and the colonies appear pale green to green. The selective agents inhibit most of the background microflora. The addition of egg yolk to the formulation of COMPASS *Bacillus cereus* Agar allows a better recovery of *Bacillus* of the *cereus* group and thus reduces the incubation time to 21 h.

Two enumeration protocols are available:

- Pour plate method;
- Spreading method.

2.1.2 Protocol

The flow diagram of the alternative method is provided in **Appendix 1**. The protocol is the following:

- Prepare an initial suspension and decimal dilutions according to ISO 6887 parts;
- For the pour plate method inoculate 1ml per petri dish from the initial suspension and/or from the successive dilutions.
- For the spreading method, inoculate 0.1 ml on 1 plate from the initial suspension and/or from the successive dilutions or 1 ml on 3 plates from the initial suspension (estimation of low number) ;
- Incubate the plates for 24 to 27 h at 30°C (COMPASS *Bacillus cereus* Agar) or 21 to 27 h at 30°C (COMPASS *Bacillus Plus* Agar);
- Count characteristic colonies (pale green to green with a diameter > 1 mm using spreading method and > 0.5 mm using the pour plate method).

2.1.3 Restrictions

There is no restriction for use.

2.2 Reference method♦

The reference method is the EN ISO 7932 standard (July 2004): horizontal method for the enumeration of presumptive *Bacillus cereus*: 30 °C colony counting technique (See **Appendix 2**).

♦ Analyses performed according to the COFRAC accreditation

3 INITIAL VALIDATION AND RENEWAL/EXTENSION STUDIES : RESULTS

3.1 Initial validation study and extension study for *COMPASS cereus* Agar

The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.

The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.

For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.

3.1.1 Method comparison study

3.1.1.1 Relative trueness study

The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.

3.1.1.1.1 Number and nature of samples

116 samples were tested for the initial validation study and 54 additional samples were tested for the renewal study performed in 2018.

Taking into account both studies, 170 samples were analysed, leading to 130 exploitable results for the spreading method and 132 for the pour plate method.

The repartition per tested category and type is provided in Table 1.

Table 1 – Categories and types

Categories	Types	Number of samples tested		Number of interpretable results			
		Initial validation study	Renewal	Spreading method	Pour plate method		
1	Meat products	a	Cooked delicatessen	8	0	7	7
		b	RTE	4	3	7	7
		c	RTRH, RTC	7	0	5	6
		Total		19	3	19	20
2	Seafood and fishery products	a	Terrines	2	8	7	7
		b	RTE	2	12	6	7
		c	RTRH, RTC	3	6	6	6
		Total		7	26	19	20
3	Dairy products	a	Milk powders	6	0	6	6
		b	Cheeses	11	0	6	6
		c	Dairy based desserts	6	2	6	5
		Total		23	2	18	17
4	Egg products	a	Pasta	3	4	6	6
		b	Powders	3	5	7	6
		c	Pastries, creams, desserts	8	0	8	8
		Total		14	9	21	20
5	Vegetables	a	Flours, Spices	3	5	8	8
		b	Dry vegetables	11	0	8	6
		c	RTE, RTRH	13	0	9	11
		Total		27	5	25	25
6	Feed	a	Dry feed	10	4	13	13
		b	Wet feed	9	0	8	9
		c	Rice, pasta, granular	7	5	7	8
		Total		26	9	28	30
Total		116	54	130	132		

3.1.1.1.2 Artificial contamination

Artificial contaminations were realised by spiking (heat treatment for 10 min at 56°C) or by seeding (inoculation by vegetative cells or by spores and storage for 2 weeks at ambient temperature, at -20°C or 48 h at 3°C ± 2°C).

The inoculated strains, the contamination protocols, the injured protocols of the inoculated vegetative cells and the injury evaluation are provided in **Appendix 3**. Injury efficiency was evaluated by enumerating the pure culture on selective and non-selective agars.

Vegetative cells or spores were inoculated in order to check the ability of spore germination on the COMPASS® *Bacillus cereus* agar.

45 samples were naturally contaminated; 29 gave interpretable result.
131 samples were artificially contaminated; 107 gave interpretable results.

The naturally contaminated samples represent 22.3 % of the interpretable results using the spreading method and 22.0 % using the pour plate method.

3.1.1.1.3 Protocol applied during the validation study

The minimum incubation time was applied during the validation study, *i.e.* 24 h at 30°C ± 1°C.

During the validation study, confirmation was performed by running a haemolysis test on five colonies per plate as described in the ISO method.

3.1.1.1.4 Raw data

The raw data are provided in **Appendix 4**.

The samples were analysed by the reference and the alternative methods in order to have 15 interpretable results per incubation protocol, and 5 interpretable results per tested type.

Two replicates were tested for the initial validation study and one replicate for the renewal study. The first replicate was kept for interpretation for the renewal study as much as possible, when no result was available; the second replicate was used for calculation for both methods.

The data are classified in four categories (See Table 2):

- Interpretable results with the reference and the alternative methods;
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with “*” in the data) in order to have a more precise result. These results were not included in the calculation.
- Results below or above the quantification limit;
- Results not determined (plates impossible to enumerate due to high level of background microflora).

According to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1 log₁₀ units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amending by adding 1 log unit more. These results are not included in the calculations but also appear on the graphs.

Table 2 - Classification of the data

Category		Interpretable results with the reference and alternative methods		Results with less than 4 colonies		Results below the quantification limit		Not determined ¹		TOTAL	
		<i>Spreading</i>	<i>Pour plate</i>	<i>Spreading</i>	<i>Pour plate</i>	<i>Spreading</i>	<i>Pour plate</i>	<i>Spreading</i>	<i>Pour plate</i>	<i>Spreading</i>	<i>Pour plate</i>
1	Meat products	19	20	2	1	1	1	0	0	22	22

* Analyses performed according to the COFRAC accreditation

3.1.1.1.5 Statistical interpretation

The calculations are provided in **Appendix 5**.

The obtained data were analyzed using the scatter plot. The graphs are provided with the line of identity ($y = x$).

The Figures 1 to 6 show the data plotted for each individual category.

The Figure 7 shows the data plotted for all the products.

**Figure 1 - Data plotted for
Meat products**

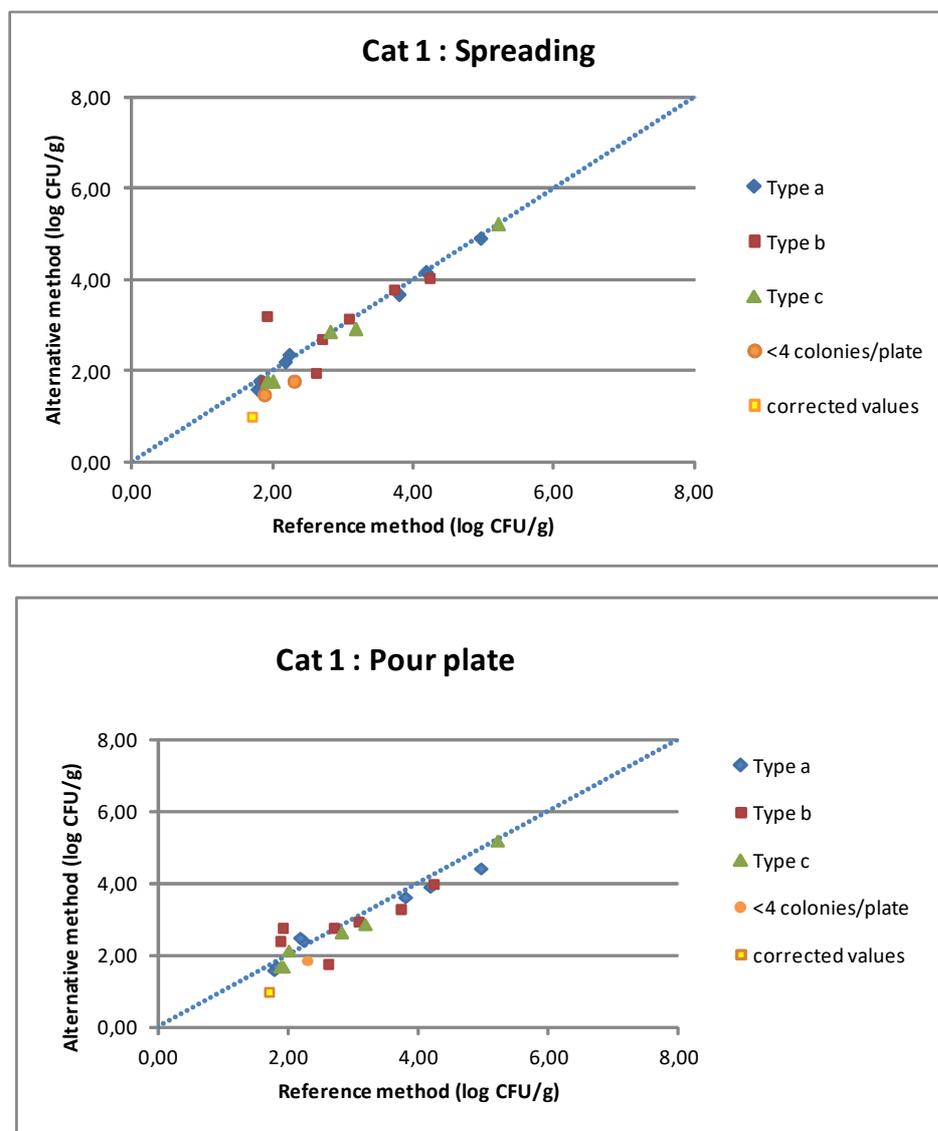

Figure 2 - Data plotted for
Seafood and fishery products

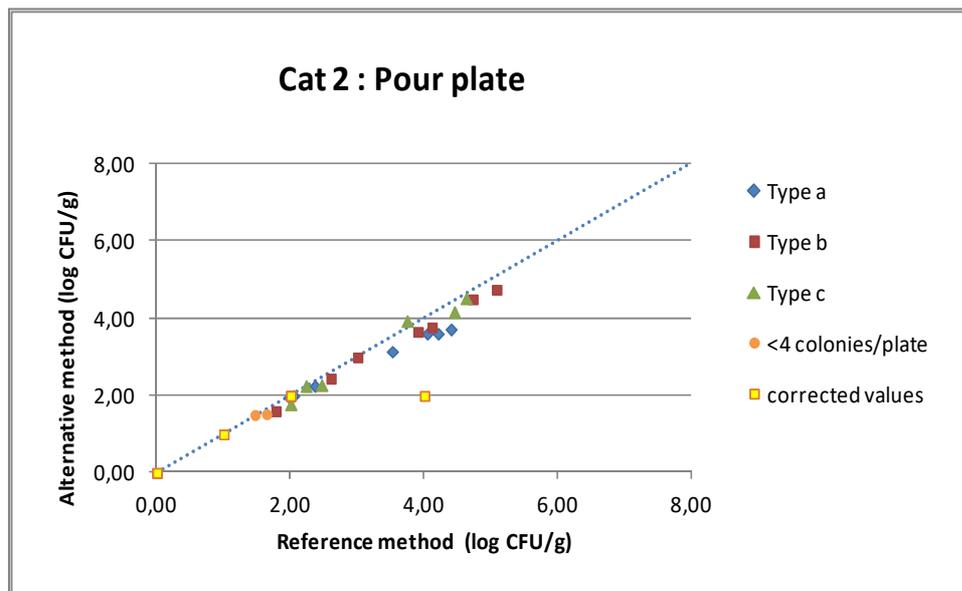

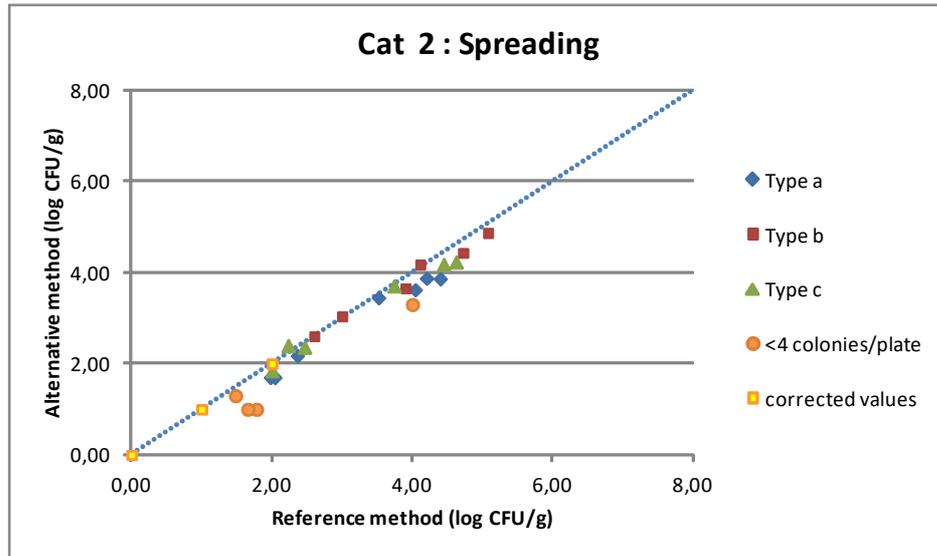

Figure 3 - Data plotted for
Dairy products

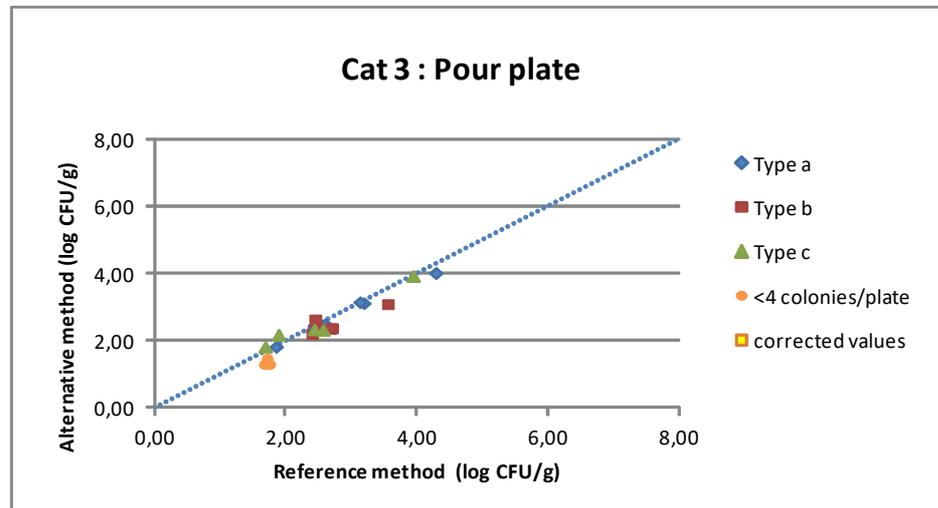

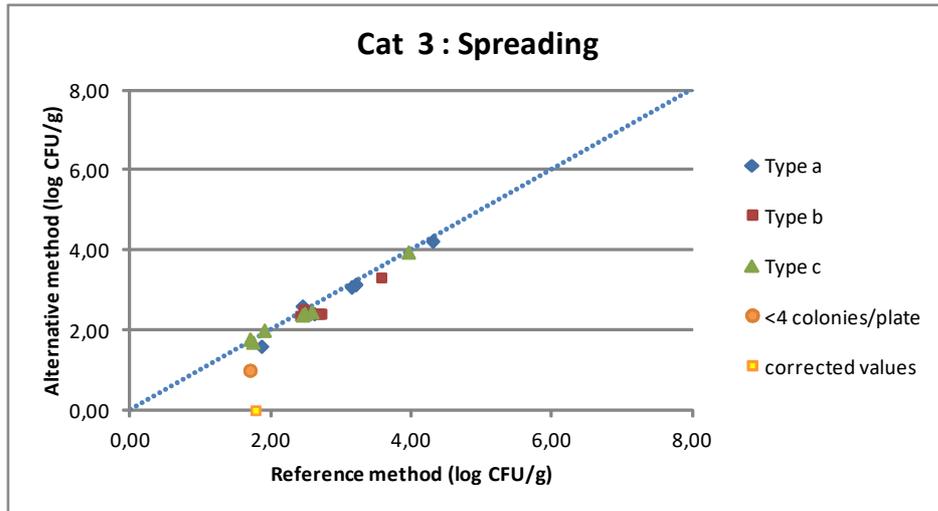

Figure 4 - Data plotted for
Egg products

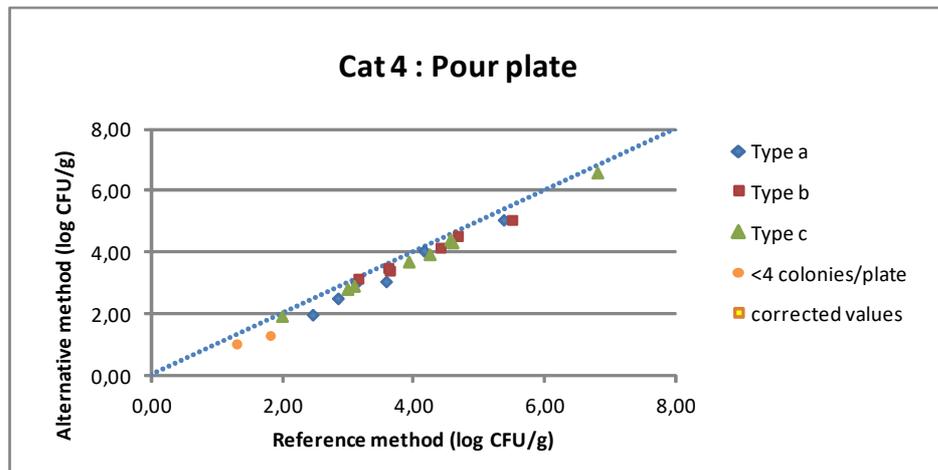

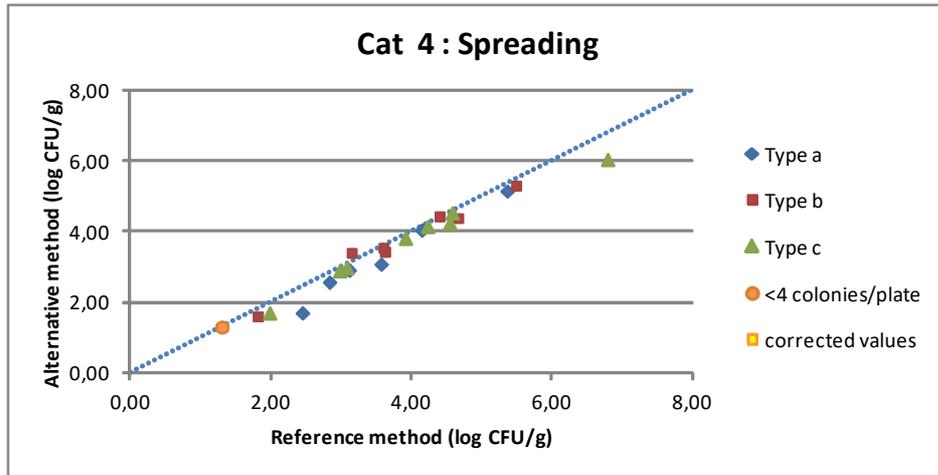

Figure 5 - Data plotted for
Vegetables

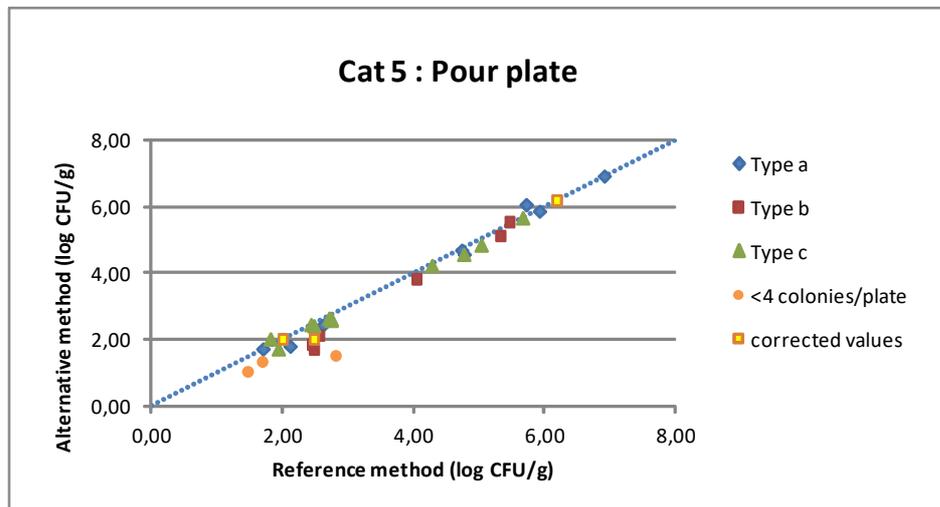

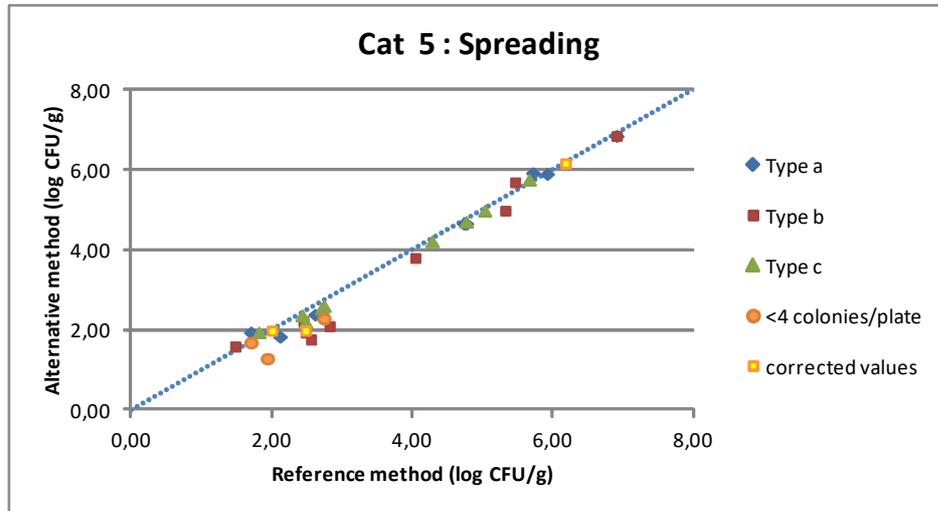

Figure 6 - Data plotted
Animal feed

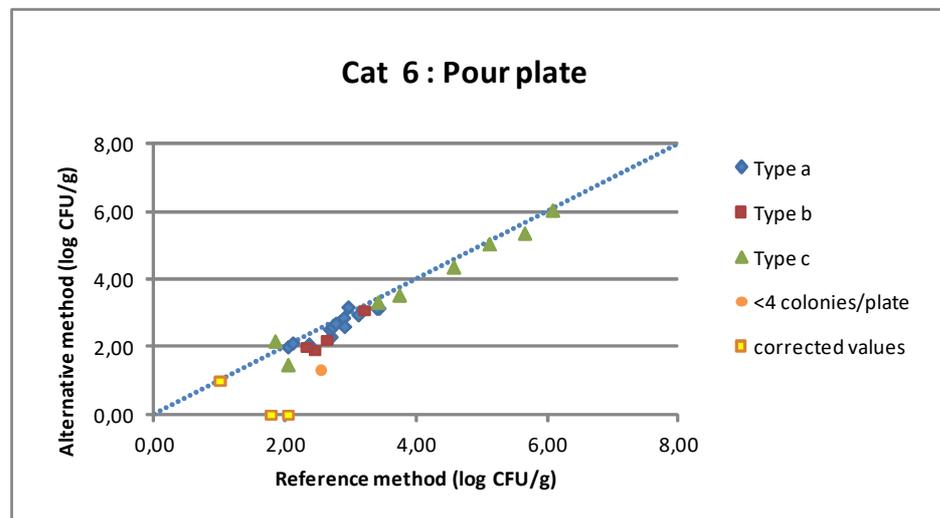

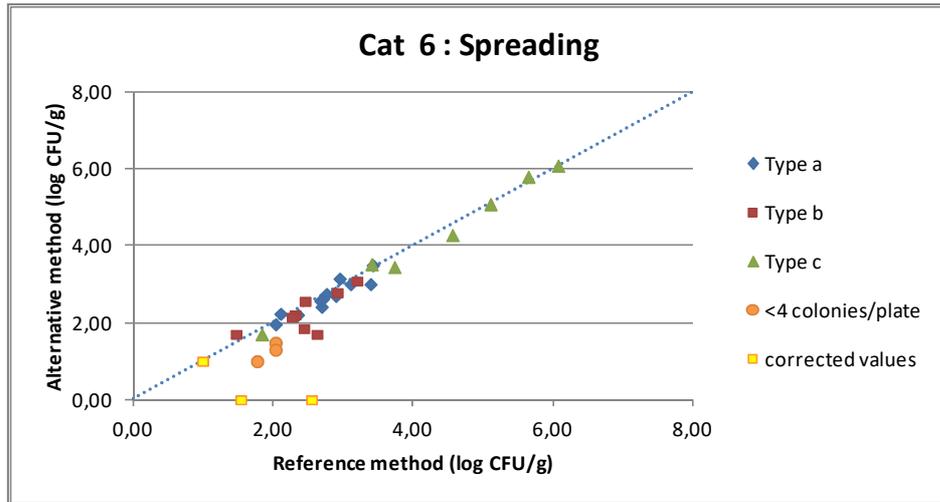

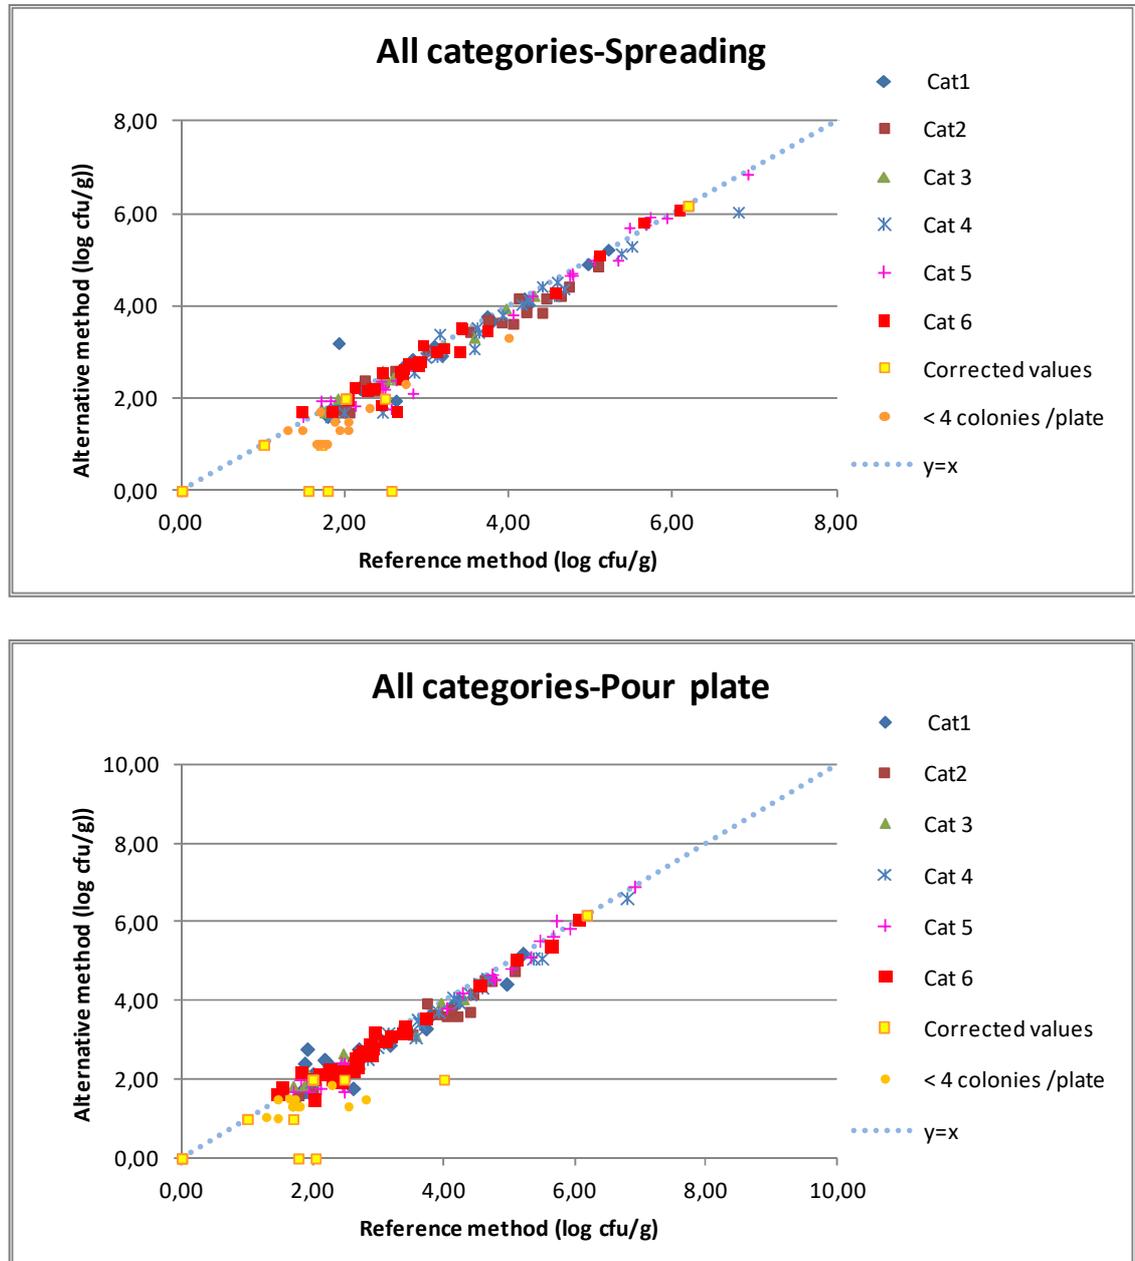

Figure 7 - Data plotted for
All the categories

The calculated values for Average difference and Standard deviation differences per category are provided in table 4.

Table 4 - Calculated values

Incubation time	Category	n	\bar{D}	SD	Linear bias	95% lower limit	95% upper limit
Spreading	1	19	-0,01	0,36	/	/	/
	2	19	-0,19	0,18	/	/	/
	3	18	-0,08	0,13	/	/	/

(1) Samples with no determined result on MYP

UCL: 95 % upper confidence limit

LCL : 95 % Lower confidence limit

If only the samples for which the plates allowed an enumeration are taken into account for the spreading method, the number of samples below the limit of agreement (6 samples) is higher than the number of samples above the limit (1 sample). This number is equivalent for the pour plate method, with 3 samples below the limit and 2 samples above the limit.

For the spreading method, for 11 samples, the differences between the two methods were comprised between - 0.65 and - 0.93 log. For one sample (1015), the difference was > - 0.78 log and for one sample (599), the difference was > - 1.56 log. For one sample, the enumeration was higher with the alternative method (+ 1.29 log).

For the pour plate method, the enumeration was higher using the reference method for 8 samples (differences varying from - 2.04 to - 0.67 log). The enumeration was higher with the alternative method for 2 samples.

Note that for 6 samples, it was impossible to give a result using the reference method as the level of background microflora was very high on the plates while the enumeration was possible with the alternative

method by both inoculation procedures. This concerns samples No 1081, 1805, 1154, 1155, 1460 and 1461.

The selectivity of the media facilitates the reading of the plates in comparison to the reference method for which high level of background microflora is often observed on MYP plates.

3.1.1.1.7 Confirmations

During the validation study, the colonies enumerated on the COMPASS *Bacillus cereus* media were confirmed using the haemolysis test (5 colonies per plate). The samples for which all the tested colonies did not give a positive haemolysis test are listed in Table 7.

Table 7 - Results on confirmation

Sample No	Product	Haemolysis result		Identification of non-haemolytic colonies by 16Sr DNA sequencing
		Spreading method	Pour plate method	
1046	Salmon terrine	Positive: 9 Negative: 0	Positive: 8 Negative: 2	<i>Carnobacterium maltaromaticum</i>
1057	Salmon terrine	Positive: 10 Negative: 10	Positive: 8 Negative: 2	<i>Leuconostoc citreum</i>
1058	RTH meal	Positive: 10 Negative: 0	Positive: 6 Negative: 1	<i>Enterococcus</i> sp.
1092	Sliced turkey meat	Positive: 0 Negative: 13	Positive: 0 Negative: 13	<i>Bacillus cereus</i> group
1155	Cheese	Positive: 10 Negative: 0	Positive: 7 Negative: 2	<i>Enterococcus faecalis</i>
1167	Buck flour	Positive: 10 Negative: 0	Positive: 8 Negative: 1	<i>Leuconostoc citreum</i>
1082	Sandwich	Positive: 10 Negative: 0	Positive: 9 Negative: 5	<i>Leuconostoc citreum</i>
1081	Pasta deli salad	Positive: 5 Negative: 0	Positive: 5 Negative: 5	<i>Leuconostoc citreum</i>
1083	Tabbouleh	Positive: 7 Negative: 0	Positive: 6 Negative: 4	<i>Leuconostoc citreum</i>

In most of the cases, the non-haemolytic strains were identified as *Leuconostoc citreum*. These colonies appear blue green and smaller than 0.5 or 1 mm. They were enumerated as they were in minority among a majority of characteristic colonies even though they were not actually typical. Even if these colonies were enumerated the impact on the result was very weak.

Strains belonging to *Leuconostoc citreum* and *Enterococcus faecalis* species were tested in the exclusivity study. They were generally not able to grow or showed non characteristic colonies (*i.e.* white or blue with a diameter <1mm).

For sample 1092, the characteristic colonies observed on COMPASS® *Bacillus cereus* Agar, are non-haemolytic but belong to the *Bacillus cereus* group, as shown by 16S rDNA sequencing. These strains can't be enumerated by the reference method or a method including the haemolysis test for confirmation. A study carried out on 339 strains belonging to *Bacillus cereus* group showed that 3.2% of the strains were non haemolytic². This phenomenon could be attributed to a mutation of the gene *PlcR3*³. This spiked sample contained a mix of *Bacillus cereus* strains, one haemolytic strain corresponding to the inoculated one, and a non-haemolytic strain which was naturally present in the matrix. This strain was probably not recovered on the MYP plates.

Note that for interpretation, all the colonies were taken into account as described in the kit insert of the COMPASS *Bacillus cereus* method.

3.1.1.1.8 Conclusion

Despite the fact that the enumerations are lower with the alternative method for 12 samples using the spreading method and for 9 samples using the pour plate method, the relative trueness study of the alternative method is satisfying.

3.1.1.2 Accuracy profile

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and β -expectation tolerance intervals, both reported to different levels of the reference value.

3.1.1.2.1 Matrices

Six matrices including two batches were tested with three contamination levels and five test portions per level. The tested categories, types, matrix and inoculated strains are provided in Table 8.

² Thaenthaneen et al., 2005. *int. J. Food. Microbiol.* 25, 203-212

³ Slamti et al., 2004. *J. Bacteriol.* 186, 3531-3538

Table 8 - Categories, types and matrices

Categories		Type	Matrix	Strains and origin	Origin	Inoculation level (CFU/g)
1	Meat products	a: Delicatessen	Pâté	<i>Bacillus cereus</i> Ad2183 (spores)	Ham	100 5 000 100 000
2	Seafood and fishery products	a: Terrine	Seafood terrine	<i>Bacillus cereus</i> Ad2477	Mussels	
3	Dairy products	a: Milk powder	Milk powder	<i>Bacillus cereus</i> Ad420	Milk powder	
4	Egg products	a: Pasta	Cooked fresh pasta	<i>Bacillus weihenstephanensis</i> Ad726 (spores)	Egg product	
5	Vegetables	c: Deli salad, rice, purées	Vegetable purée	<i>Bacillus mycoïdes</i> Ad761	Vegetables	
6	Feed	a: Dry products	Pellets for dog	<i>Bacillus thuringiensis</i> Ad2786	Vegetables	

3.1.1.2.2 Calculation and interpretation

The raw data are provided in **Appendix 6**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 7**. The statistical results and the accuracy profiles are provided Figure 9 (Spreading method) and Figure 10 (Pour plate method).

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 2027-01-2015 available on <http://standards.iso.org/iso/16140>

Figure 9 – Accuracy profile - Spreading method

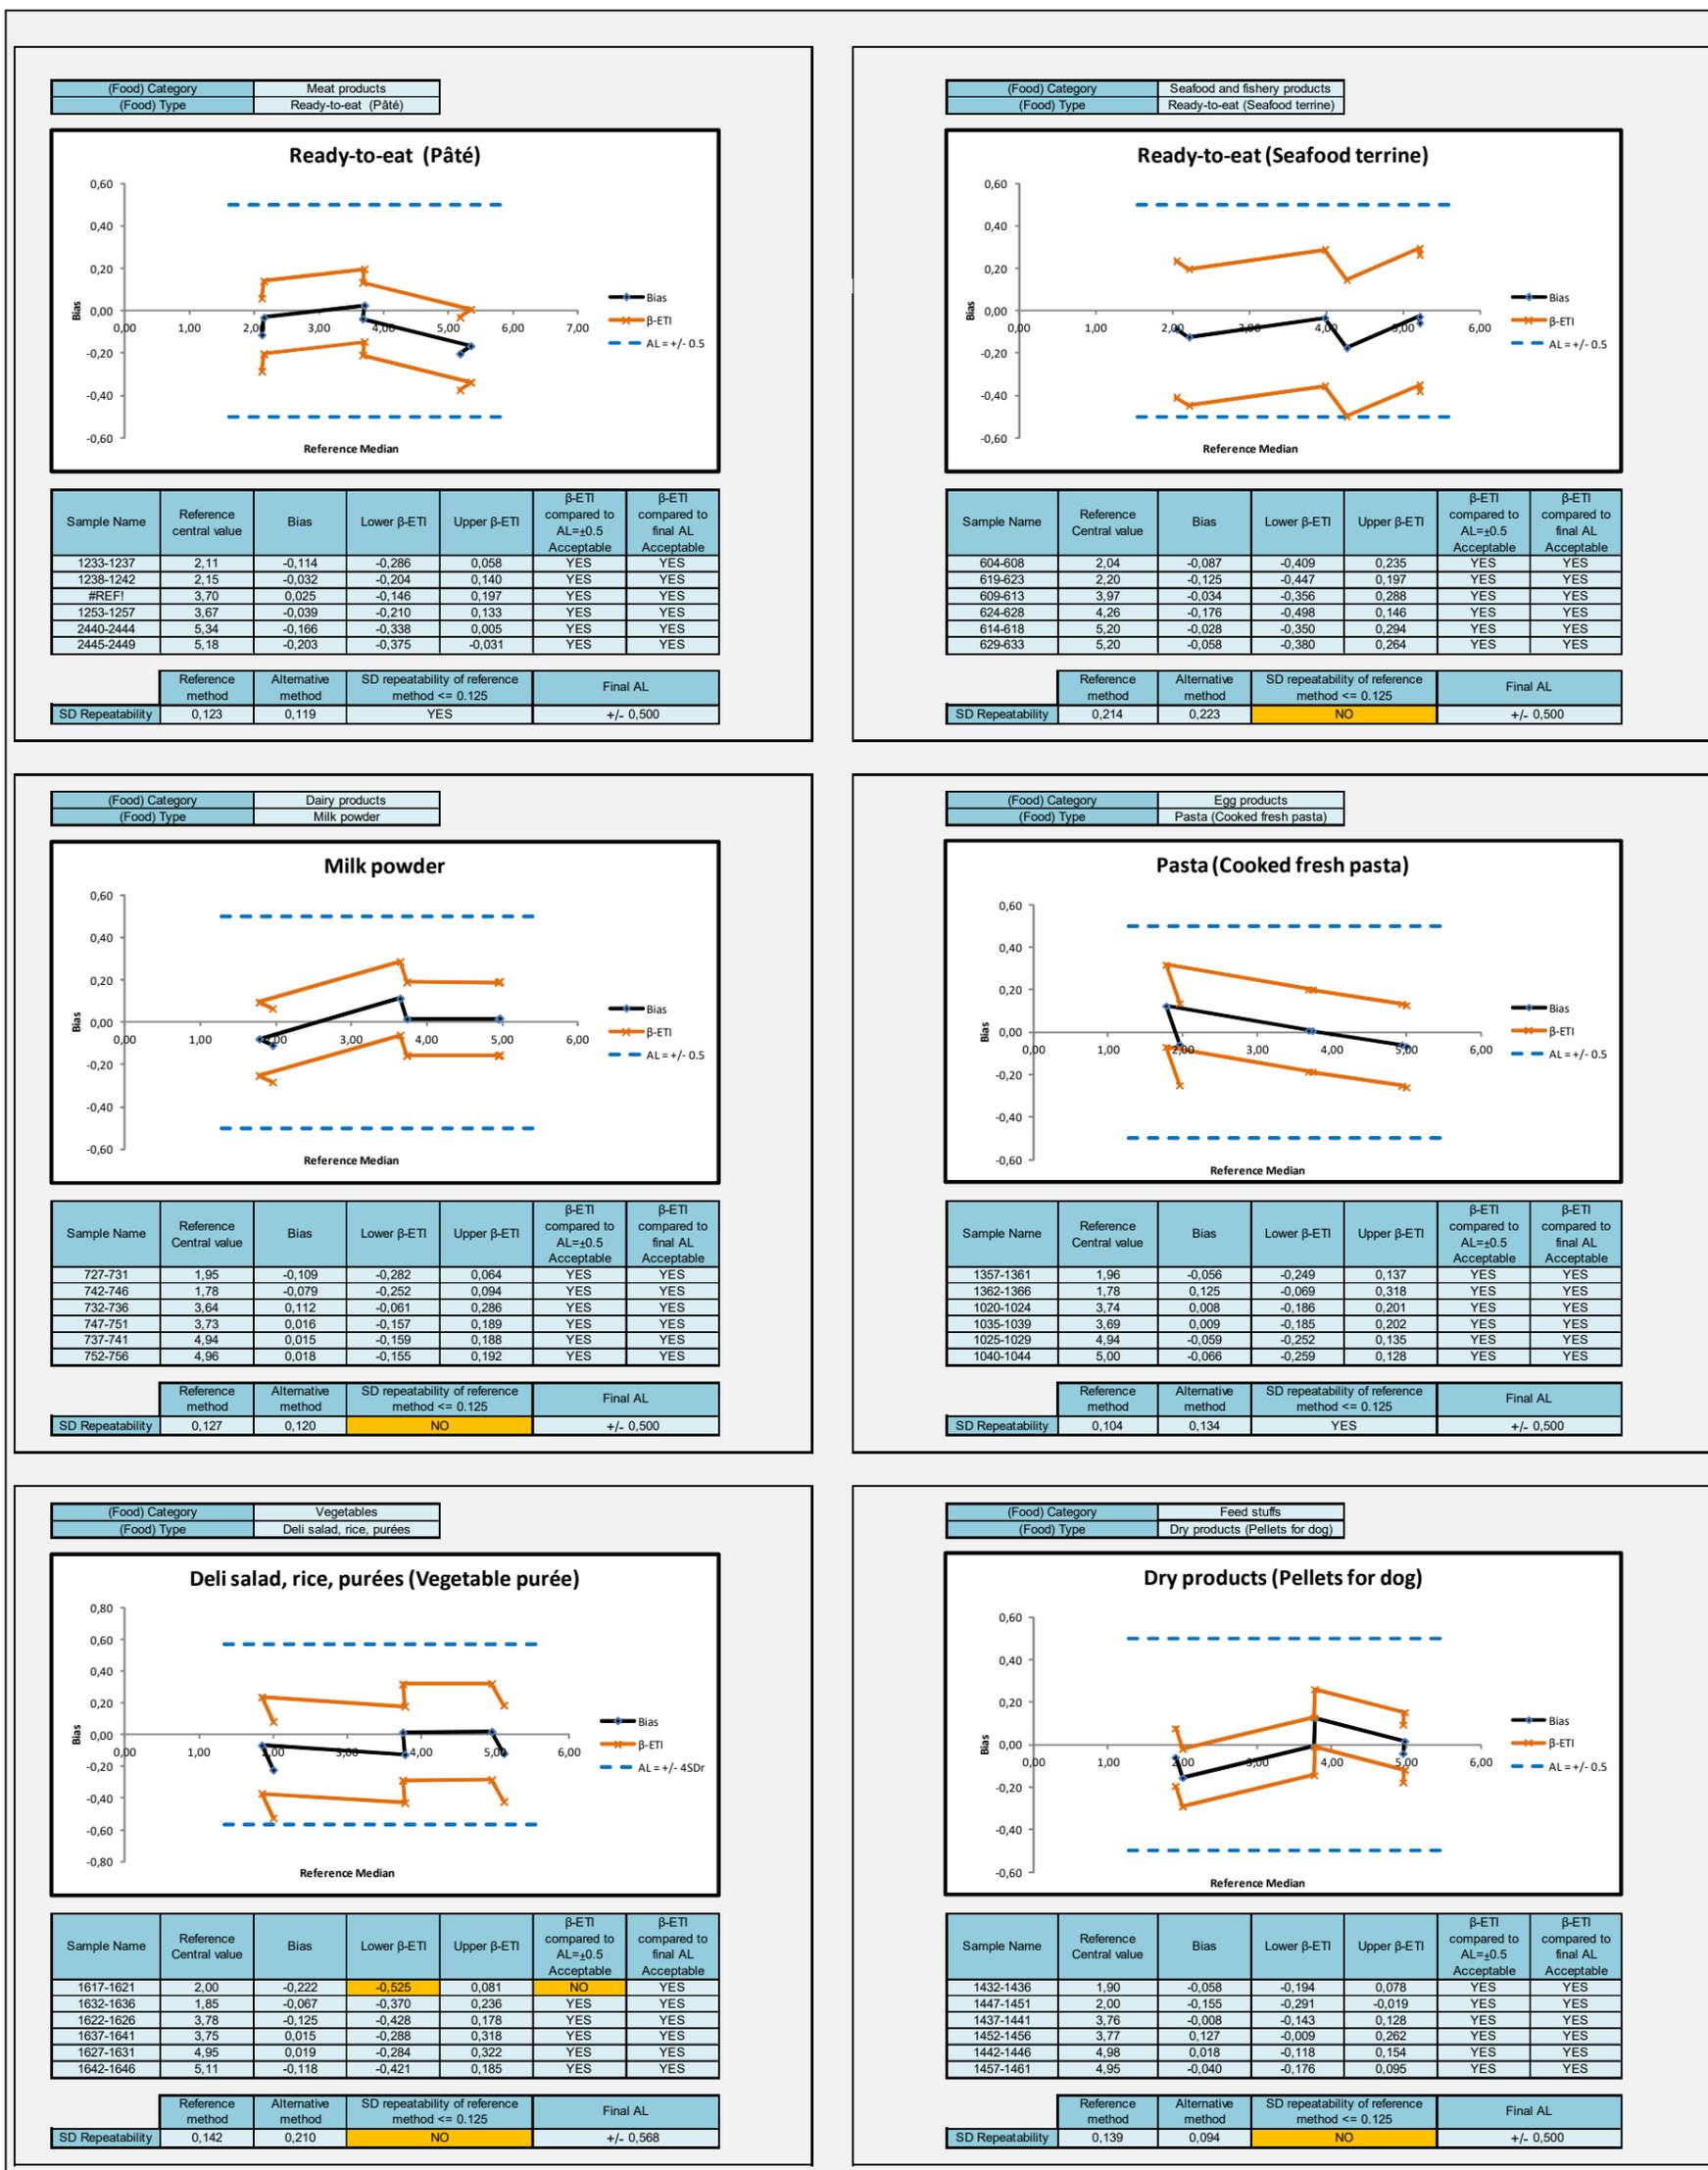

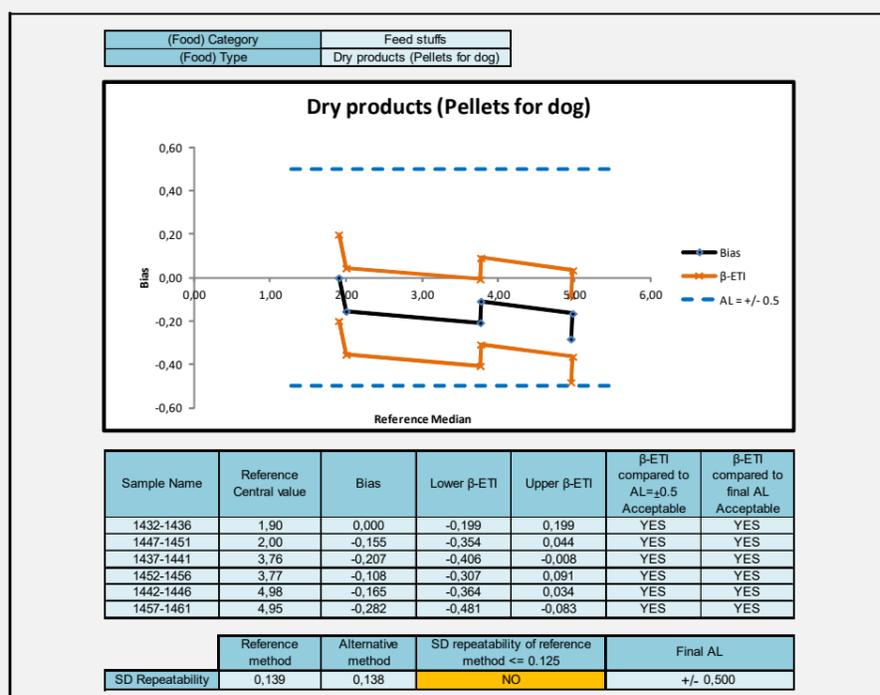

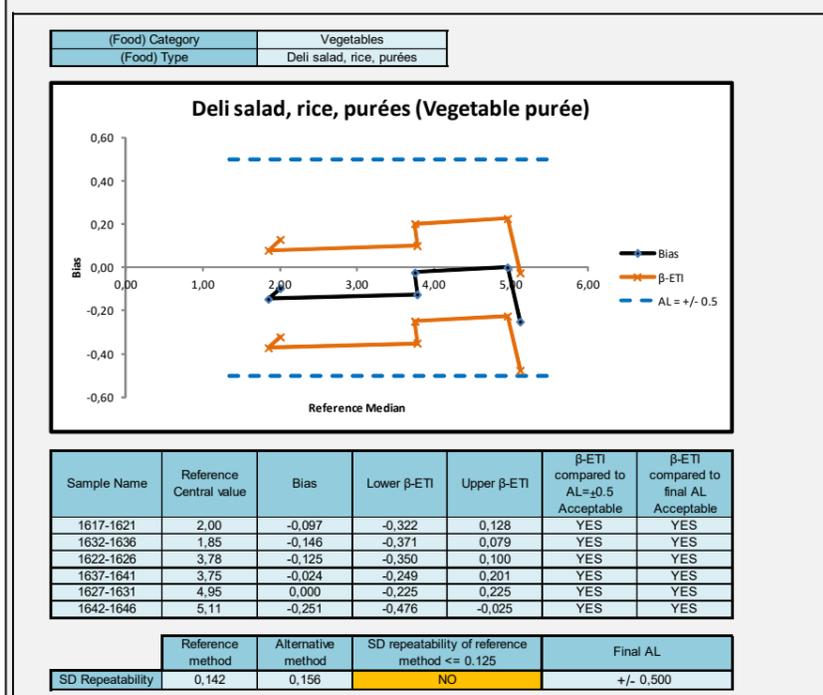

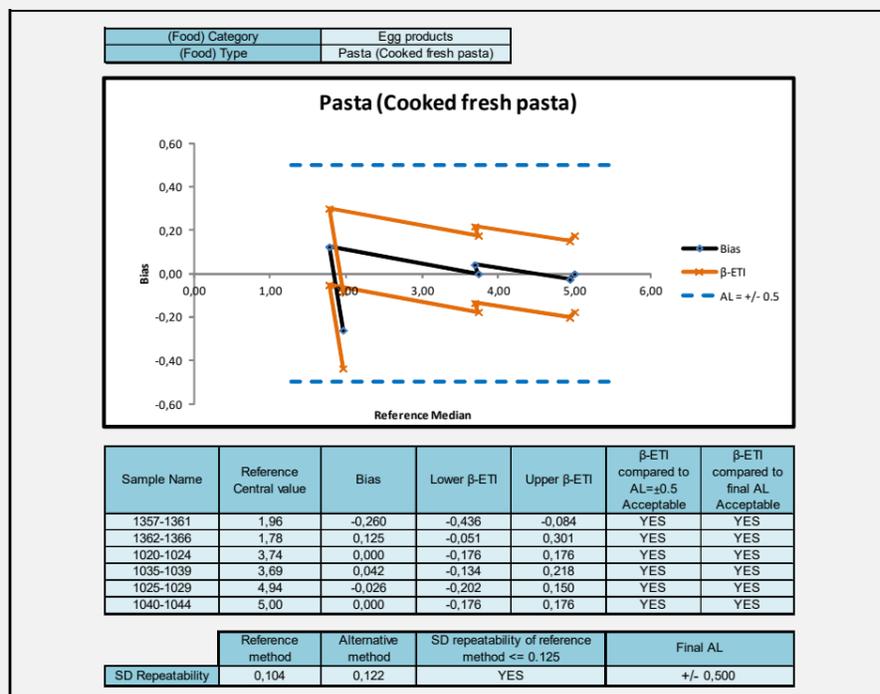

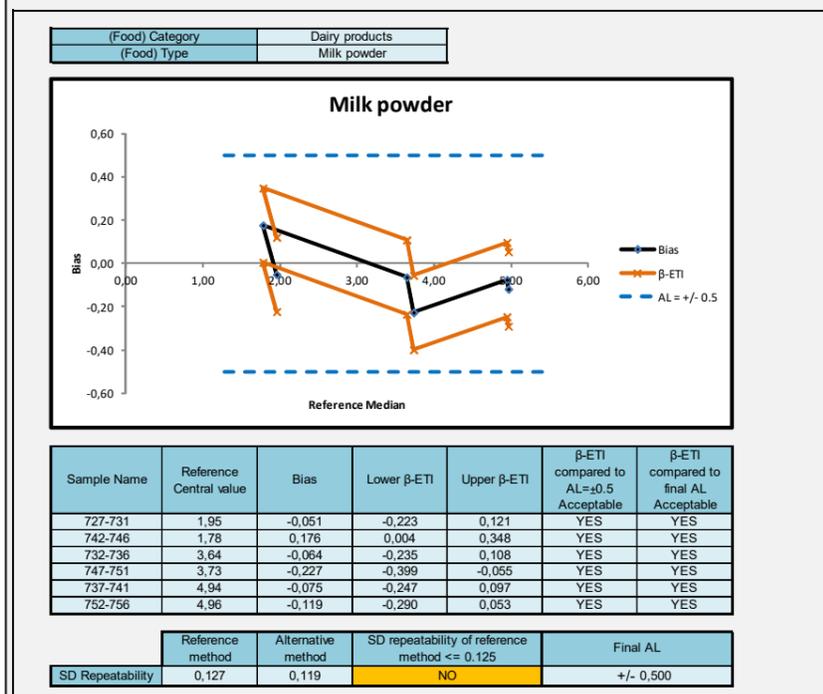

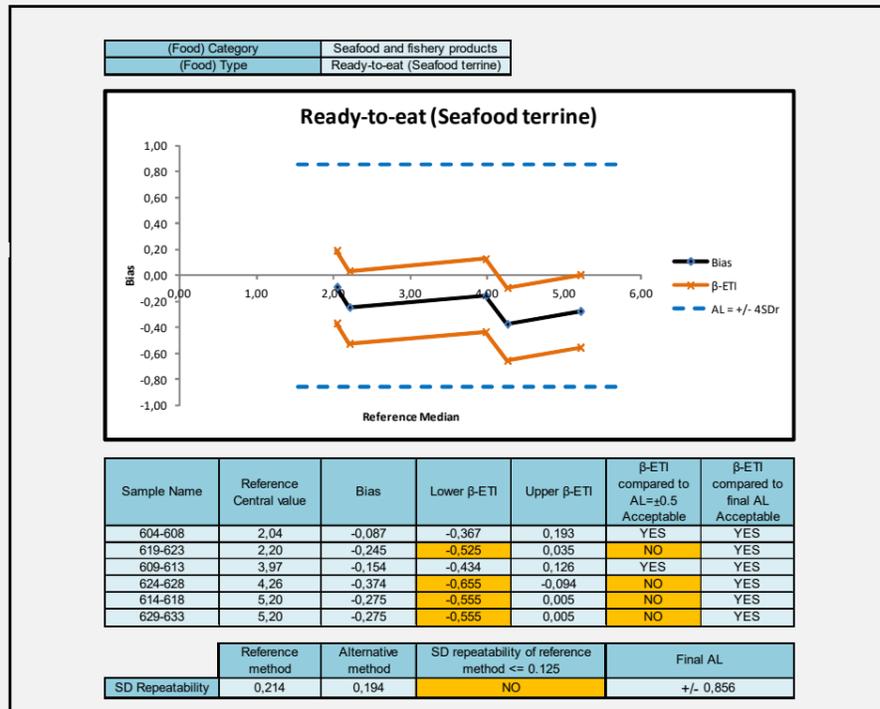

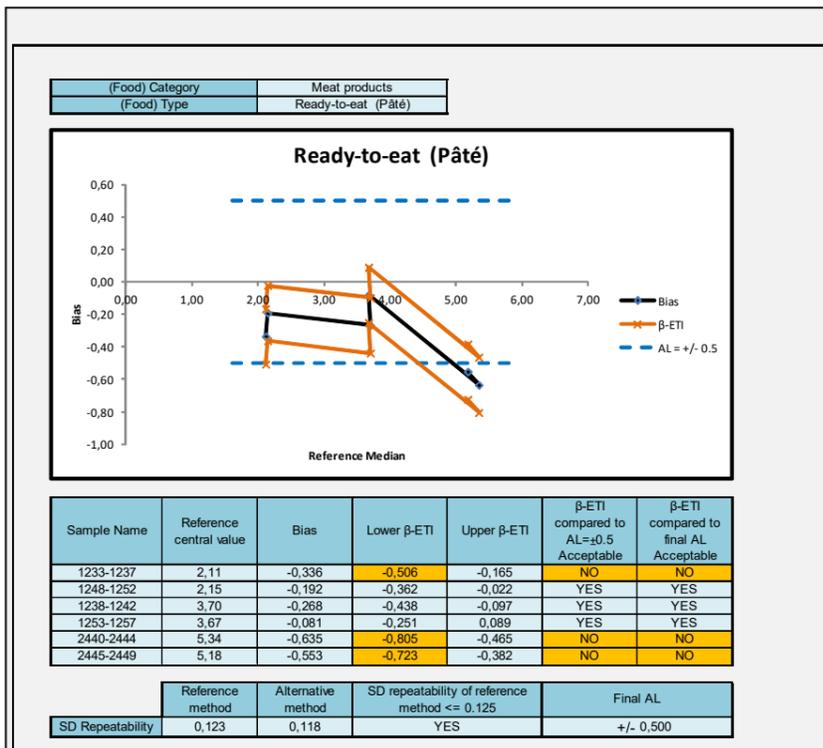

Figure 10 – Accuracy profile - Pour plate method

The observed profiles are within the Acceptability Limits for all the matrices tested using the pour plate method, except for the ready-to-eat product (pâté). In this case, the lower β .ETI are above the Acceptability Limit for one batch inoculated at the low inoculation level (lower β .ETI = - 0.506) and for the higher inoculation level (two batches) (lower β .ETI = - 0.805 and - 0.723).

This result could be due to the fact that at this dilution level, the matrix is no more present in the suspension and the inhibitory effect of the selective agents present in the media has more impact on the tested strains when the pour plate method is used. This phenomenon was not observed in the trueness study and is probably specific to the strain used for the accuracy profile.

The observed profiles are within the Acceptability Limits fixed at ± 0.5 log for all the matrices tested using the spreading method. For the vegetable purée, the AL is fixed at ± 0.568 log.

3.1.1.2.3 Conclusion

The observed profiles are comprised within the Acceptability Limits, except for the pâté with the pour plate method (low and high inoculation level).

3.1.1.3 Inclusivity and exclusivity

The inclusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

3.1.1.3.1 Protocol

Inclusivity

36 strains were tested for the initial validation study; 14 additional strains were tested for the renewal study.

Each test was performed once with the alternative method, the reference method and a non-selective agar.

Exclusivity

41 strains were tested for the initial validation study; no additional testing was required for this part.

3.1.1.3.2 Results

The raw data are provided in **Appendix 8**.

Inclusivity

Among the 50 strains used for the inclusivity test, 47 gave characteristic green colonies on COMPASS® *Bacillus cereus* Agar, whatever the inoculation method used. One strain (*Bacillus pseudomycoïdes* Ad765) gave typical colonies with the spreading method only.

Note that for some strains, addition of 1 % UHT milk in the last dilution was necessary to recover the strains.

Two strains (*Bacillus pseudomycoïdes* Ad766 and *Bacillus cytotoxicus* Ad2163) did not grow on the COMPASS *Bacillus cereus* agar whatever the inoculation procedure used.

Exclusivity

All of the strains used for the exclusivity test appeared non-characteristic.

3.1.1.4 Practicability

Practicability was evaluated according to the criteria defined in the validation study requirements:

Storage conditions, shelf-life and modalities of utilisation after first use	All media should be stored at 2-8°C. The storage best before date is displayed on the boxes.		
✓ Time to result	Step	Reference method	Alternative method
	Analysis	D0	D0
	Enumeration	D1 - D2	D1
	Confirmation	D3	/
	Final result	D3	D1
✓ Steps common with the reference method	Initial suspension		

Enumeration is obtained in one day using the COMPASS® *Bacillus cereus* method while three days are required for the reference method when typical colonies are observed.

3.1.1.5 Method comparison study conclusions

The relative trueness of the alternative method is satisfying.

The characteristic colonies appear blue green with a diameter > 0.5mm for the pour plate method and > 1mm for the spreading method.

Some colonies observed on COMPASS® *Bacillus cereus* Agar, using the pour plate method were not identified as *Bacillus cereus*. These colonies were not characteristic using the spreading method as they were blue and smaller than 1mm. In a majority of the cases, such colonies were enumerated as they were in minority among characteristic colonies belonging to the *Bacillus cereus* group. The fact to take into account these colonies for enumeration had few impacts on the result

It is advised in the kit insert to proceed to confirmatory tests using the haemolysis test in case of doubtful aspect of the colonies.

In most of the cases (11 over 12 tested) the observed accuracy profiles are comprised with the Acceptability Limit (AL).

The COMPASS® *Bacillus cereus* method is specific and selective.

A non-haemolytic strain was enumerated on COMPASS® *Bacillus cereus* Agar but was confirmed as *Bacillus cereus* using 16S rDNA sequencing, Anyway, such colonies would not have been taken into account by the reference method as the confirmation is based on haemolysis test.

The alternative method is more selective than the reference method, which facilitates the reading of the plates.

The enumeration is obtained in 1 day with the COMPASS® *Bacillus cereus* Agar while 2 days are required for the ISO 7932.

3.1.2 Inter-laboratory study

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

The results of the inter-laboratory study run in 2010 were interpreted according to the EN ISO 16140-2:2016 standard using the Excel spread sheet available at <http://standards.iso.org/iso/16140>

3.1.2.1 Study organisation

Fourteen laboratories took part in the study. The study focused on custard inoculated with *Bacillus cereus* strain MJG03 spores isolated from liquid egg product.

The target inoculation rates were as follows:

- 0 CFU/g,
- 10-100 CFU/g,
- 100-1,000 CFU/g,
- 1,000-10,000 CFU/g.

10 ml of each sample was dispensed to a bottle. Two samples per inoculation and per laboratory were prepared, i.e. eight samples per laboratory. An additional bottle was appended to the package for enumeration of the aerobic mesophilic flora via the NF EN ISO 4833 method.

The samples were shipped on Monday 04 January 2010 and analysed on Wednesday 06 January 2010.

The coded samples (code known only to the expert laboratory) were placed in isothermal boxes containing refrigerant blocks and shipped to the various laboratories by means of an express transport system.

A temperature control bottle containing a temperature recorder was added to the package, in order to monitor the temperature during transport and to measure it upon receipt.

Each laboratory, identified by a letter, received the following:

- Eight encoded custard samples (10 g) in Stomacher bags for the enumeration of *Bacillus cereus* by reference method ISO 7932 and by the COMPASS® *Bacillus cereus* method,
- One non-encoded custard sample (10 g) for the enumeration of aerobic mesophilic flora in custard by the ISO 4833 method,
- One control bottle containing water and a thermo-button was added to each package to monitor temperature during transport, upon receipt and during storage by the laboratory until analysis.

The collaborators and the expert laboratory analysed the samples using the reference methods and the alternative method (using the spreading method).

3.1.2.2 Experimental parameter controls

3.1.2.2.1 Strain stability during transport

In order to verify the stability of *Bacillus cereus* strain MJG03, six samples (3 contamination levels x 2 samples) were enumerated after storage for 24 and 48 h at 4 °C. The results are given in Table 9.

Table 9 – Enumeration of *Bacillus cereus* MJG03

Analysis day	Contamination level	Reference method	Alternative method
Day 0	1	180	120
		110	180
	2	1,400	1,300
		1,500	1,800
	3	15,000	15,000
		14,000	14,000
Day 1	1	210	160
		180	180
	2	1,800	1,700
		2,000	1,600
	3	18,000	19,000
		27,000	17,000
Day 2	1	160	82
		130	160
	2	2,200	2,000
		1,900	1,900
	3	24,000	19,000
		17,000	15,000

No evolution was observed during storage for 48 h at 5°C ± 3°C.

3.1.2.2.2 Logistic conditions

The temperatures measured at reception by the Labs, the temperatures registered by the thermo-probe, and the receipt dates are given in Table 10.

Table 10 - Sample temperatures at receipt

Laboratories	Temperature measured by the probe- (°C)	Temperature measured upon receipt (°C)	Receipt date and time
A	1.5	5.0	D1 - 1:30pm
B	1.5	4.5	D1 - 2:30pm
C	1.5	4.2	D1 - 3:30pm
D	2.5	4.8	D1 - 10am
E	1.5	0.8	D1 - 10:20am
F	0.0	2.3	D1 - 11am
G	<i>Defective thermo probe</i>	3.4	D1 - 9am
H	0.5	2.2	D1 - 10am
I	0.5	1.8	D1 - 8:30am
J	0.0	2.2	D1 - 9:45am
K	1.5	1.0	D1 - 9:30am
L	0.0	1.0	D1 - 9:30am
M	0.5	1.5	D1 - 11:30am
N	Not received	2.9	D1 - 10am

No problem was encountered during the transport or at receipt for the 14 collaborators. All the samples were delivered on time and in appropriate conditions. The temperatures measured during transport varied from 0 to 2.5°C.

3.1.2.3 Results analysis

The raw data are given in **Appendix 9**.

3.1.2.3.1 Aerobic mesophilic microflora enumeration

The aerobic microflora enumeration in the matrix was performed according to the ISO 4833-1. The enumeration varies from < 10 to 60 CFU/g

3.1.2.3.2 Results obtained by the Expert laboratory

The results obtained by the expert Lab. are the following (See table 11).

Table 11 – Results obtained by the expert Lab (FCU/g)

Level	Reference method	Alternative method
L0	< 10 / < 10	< 10 / < 10
L1	160 / 130	82 / 60
L2	2 200 / 1 900	2 000 / 1 900
L3	24 000 / 17 000	19 000 / 15 000

3.1.2.3.3 Results obtained by the collaborators

Samples were sent to 14 collaborators.

A summary of the test results is given in Table 12 (CFU/g) and Table 13 (log CFU/g).

Table 12 - Summary of data (CFU/g)

Labora- tories	Level 0				Level 1				Level 2				Level 3

3.1.2.4 Calculation and interpretation

3.1.2.4.1 Visual linearity checking

The Figure 11 shows the data points after \log_{10} transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method. The data are distributed closely to the first bisecting lines with a slope equal to 1.

Figure 11 - Visual linearity checking

3.1.2.4.2 Accuracy profile calculation

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140>. A summary of the statistical test is provided in Table 14.

Table 14 - Summary of statistical tests

Accuracy profile						
Study Name	COMPASS <i>Bacillus cereus</i>					
Date	2010					
Coordinator	ADRIA Développement					
Tolerance probability (beta)	80%	80%	80%			
Acceptability limit in log (lambda)	0,50	0,50	0,50			
FAUX						
Application of clause 6.2.3 Step 8: If any of the values for the β -ETI fall outside the acceptability limits, calculate the pooled average reproducibility standard deviation of the reference method. Step 9: Calculate new acceptability limits as a function of this standard deviation.

Lower Acceptability Limit	-0,50	-0,50	-0,50			
Upper Acceptability Limit	0,50	0,50	0,50			
New acceptability limits may be based on reference method pooled variance						
Pooled repro standard dev of reference	0,101					
				FAUX X FAUX X		

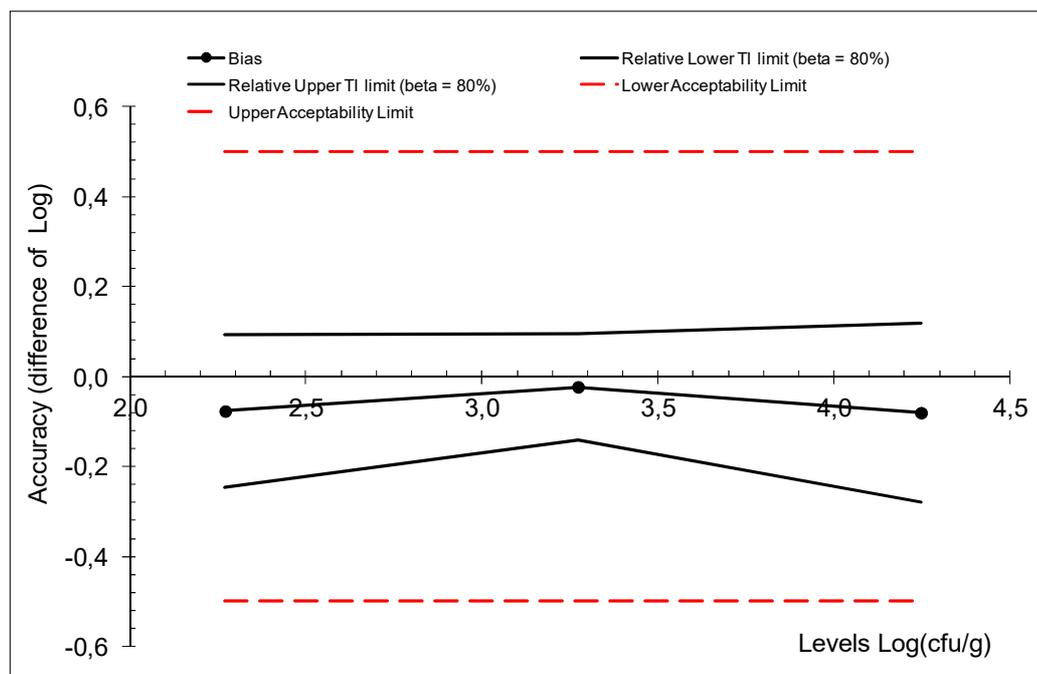

Obtained values are summarized in Table 15.

Table 15 - Summary of obtained values (log CFU/g)

	Alternative method		
	Low	Medium	High
Target value	2,270	3,273	4,247
Bias	-0,077	-0,023	-0,081
Lower β .ETI (80 %)	-0,247	-0,142	-0,280
Upper β .ETI (80 %)	0,094	0,096	0,119
Lower AL	-0,5		
Upper AL	+0,5		

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given Figure 12 for interpretation with 14 collaborators.

Figure 12 – Accuracy profile -

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptability limits of ± 0.5 log.

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of ± 0.5 log.

The results obtained with the alternative method are not statically different than those obtained with the reference method. The alternative method is considered equivalent to the reference method.

3.2 Extension study for *COMPASS Bacillus Plus Agar*

3.2.1 *Relative trueness study*

The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.

3.2.1.1 *Number and nature of the samples*

Five food categories and the animal feed were tested. The repartition per tested category and type is provided in Table 16.

Table 16 – Number of exploitable results per categories, types and protocol

Category	Type	Number of analysed samples	Number of interpretable results	
			Spreading method	Pour plate method
1	a	Raw meat-based preparations	5	5
	b	RTE	6	5
	c	RTRH, RTC	6	5
	Total		17	15
2	a	Milk powders	8	5
	b	Cheeses	9	5
	c	Dairy based desserts	5	5
	Total		22	15

	c	RTC	5	5
	Total		29	18
5	a	Cereals	5	5
	b	Spices	11	5
	c	Vegetables and fruits	12	6
	Total		28	16
6	a	Flours and cakes for livestock	6	5
	b	Terrines, pâtés for pet	5	5
	c	Low moisture products for pet	7	5
	Total		18	15
All categories		140	97	97

140 samples were analysed leading to 97 interpretable results by the alternative method whatever the inoculation method.

3.2.1.2 *Artificial contamination*

Seeding protocols (inoculation by vegetative cells or spores and storage for 2 weeks at room temperature, -20°C or 48 h at $3^{\circ}\text{C} \pm 2^{\circ}\text{C}$) or spiking protocols (heat treatment for 10 min at 56°C) were used to inoculate the samples. When using the spiking protocol, an evaluation of the stress applied was performed by differential enumeration on non-selective agar (TSA) and selective agar (MYP).

112 samples were artificially contaminated; 90 samples gave interpretable by the spreading method and the pour plate method. 7 interpretable results by both methods were obtained from naturally contaminated samples, representing 7.2% of the exploitable samples.

Note that 10 samples not inoculated showing typical colonies on the plates were enumerated by either method, but with a number of colonies present of less than 4, making it impossible to retain the result for interpretation.

For 3 naturally contaminated samples, the result was not interpretable by the reference method because of an excessive level of background microflora, whereas the results obtained by the alternative method were interpretable.

The inoculated samples, the strains and the injury protocols applied are given in **Appendix 10**.

3.2.1.3 *Protocols applied during the extension study*

Inoculation

Both inoculation procedures were tested during the validation study:

- Spreading method;
- Pour plate method.

Incubation

The minimum incubation time was applied during the validation study, *i.e.* 21 h at $30^{\circ}\text{C} \pm 1^{\circ}\text{C}$.

Confirmation

During the validation study, confirmation was performed by running a haemolysis test on five colonies per plate as described in the ISO method.

3.2.1.4 Raw data

The raw data of the extension study (2019) are given in **Appendix 11**.

The data are classified in four categories (See Table 17):

- Interpretable results with the reference and the alternative methods;
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with "*" in the data) in order to have a more precise result. These results were not included in the calculation.
- Results below or above the quantification limit;
- Results not determined (plates impossible to enumerate due to high level of background microflora).

According to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1 log₁₀ units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amending by adding 1 log unit more. These results are not included in the calculations but also appear on the graphs.

Table 17 - Classification of the data

Category	Type	Spreading method					Pour plate method						
		Analysed	Interpretable	< 4 CFU/g	< or > limit	Not determined	Analysed	Interpretable	< 4 CFU/g	< or > limit	Not determined

3.2.1.5 Statistical interpretation

The calculations are provided in **Appendix 12**. The obtained data were analysed by using the Bland-Altman method.

The obtained data were analyzed using the scatter plot. The graphs are provided with the line of identity ($y = x$).

The Figures 13 to 18 show the data plotted for each individual category.

The Figure 19 shows the data plotted for all the products.

**Figure 13 - Data plotted for
Meat products**

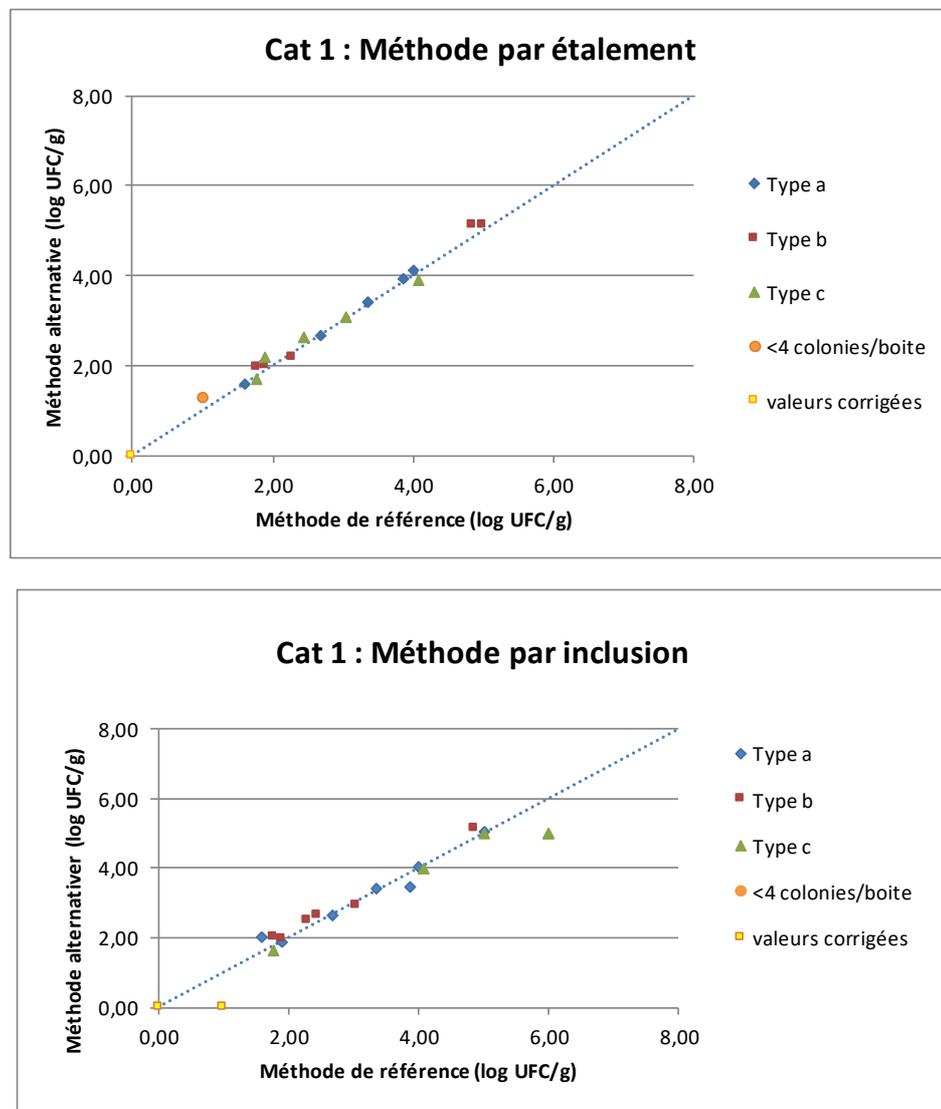

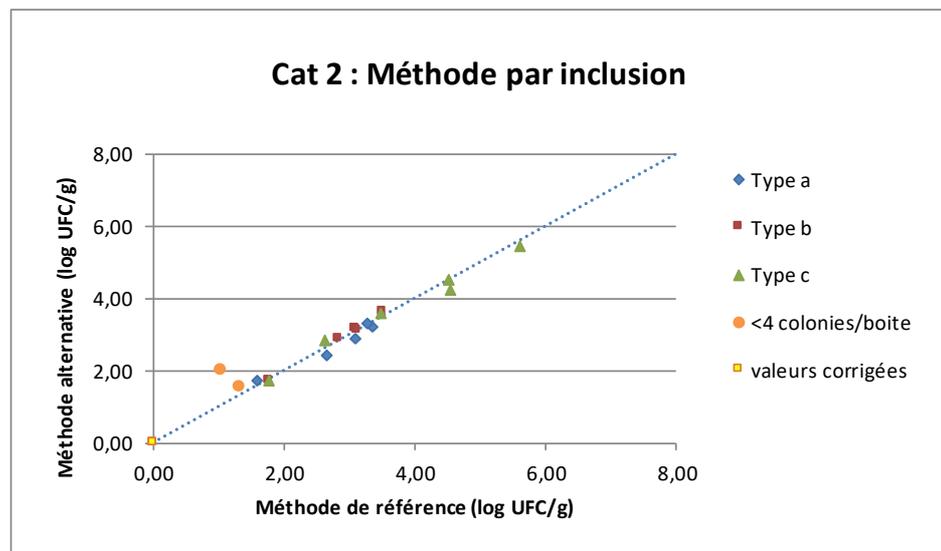

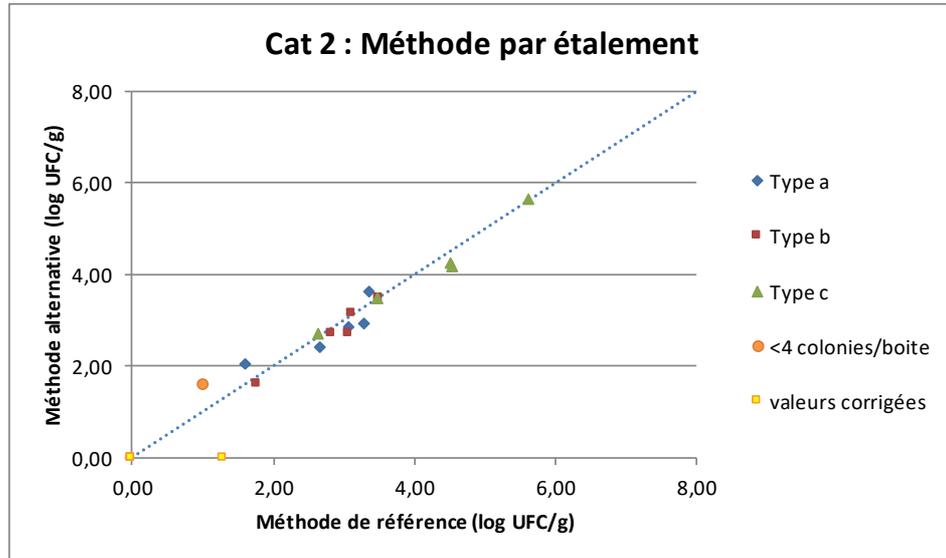

Figure 14 - Data plotted for
Dairy products

**Figure 15 - Data plotted for
Fishery products - Egg products**

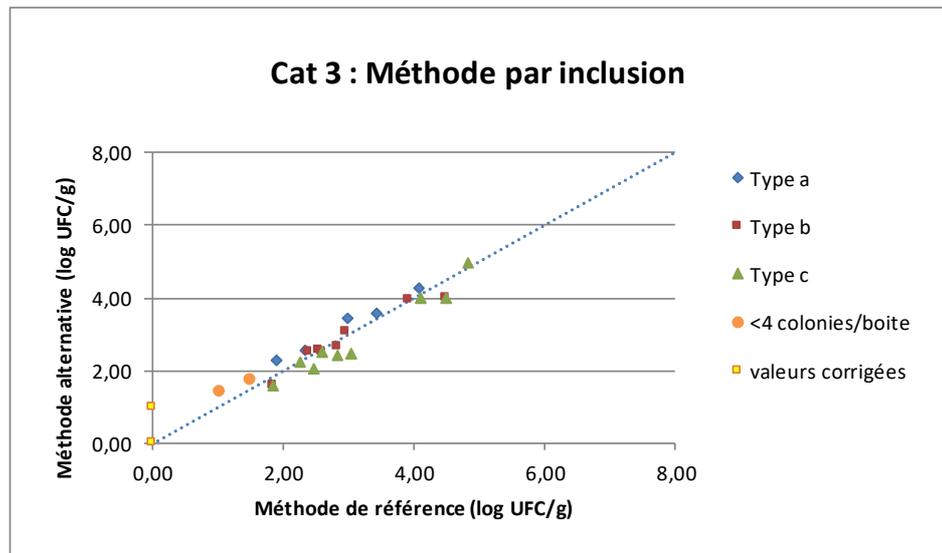

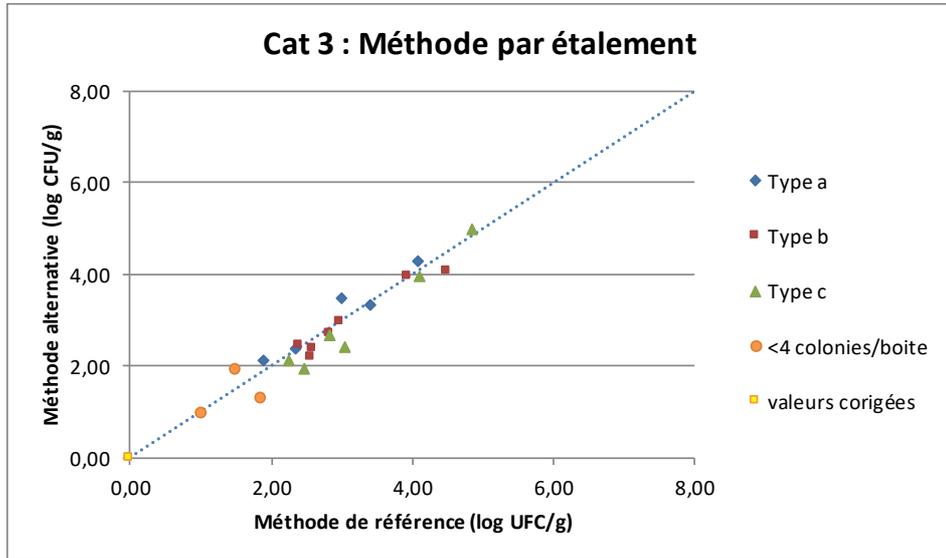

Figure 16 - Data plotted for
Composite products

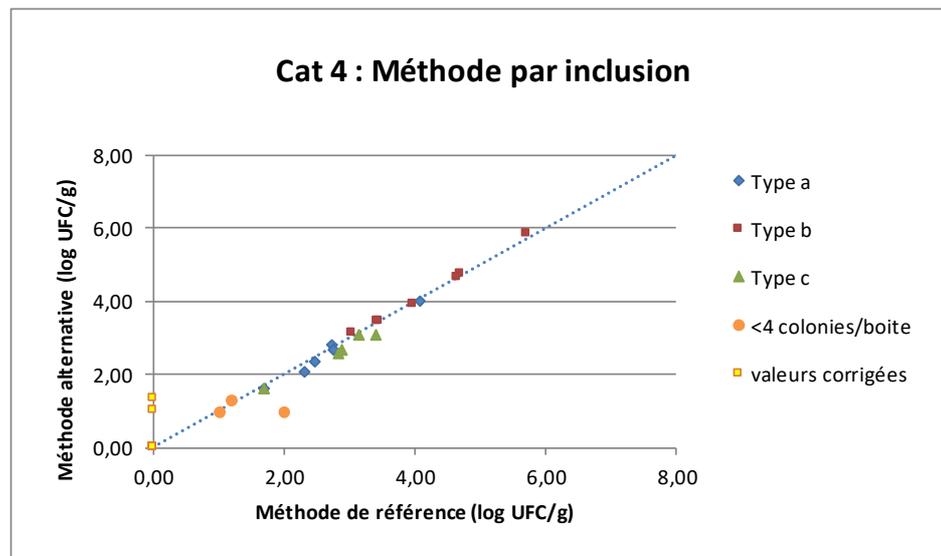

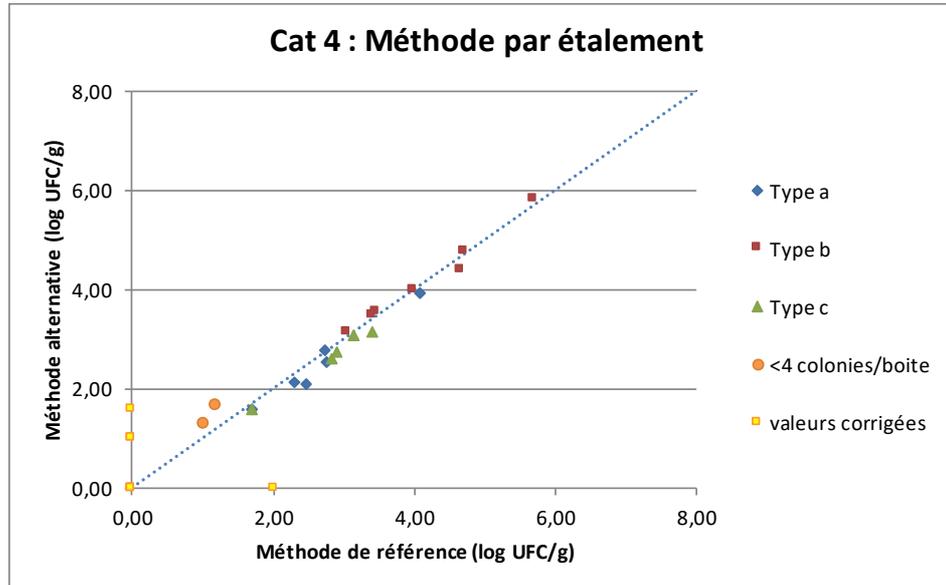

Figure 17 - Data plotted for
Cereals, spices, vegetables, fruits and dehydrated vegetables

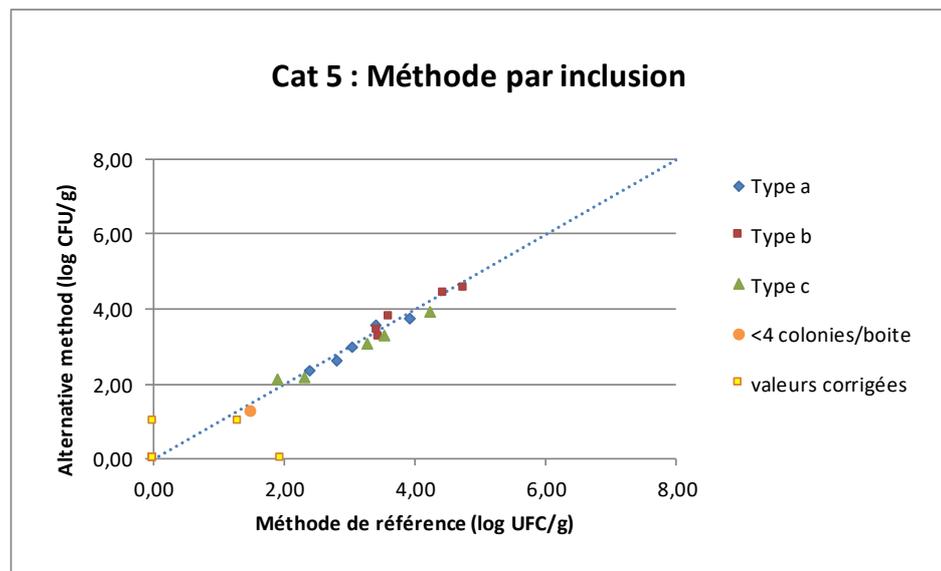

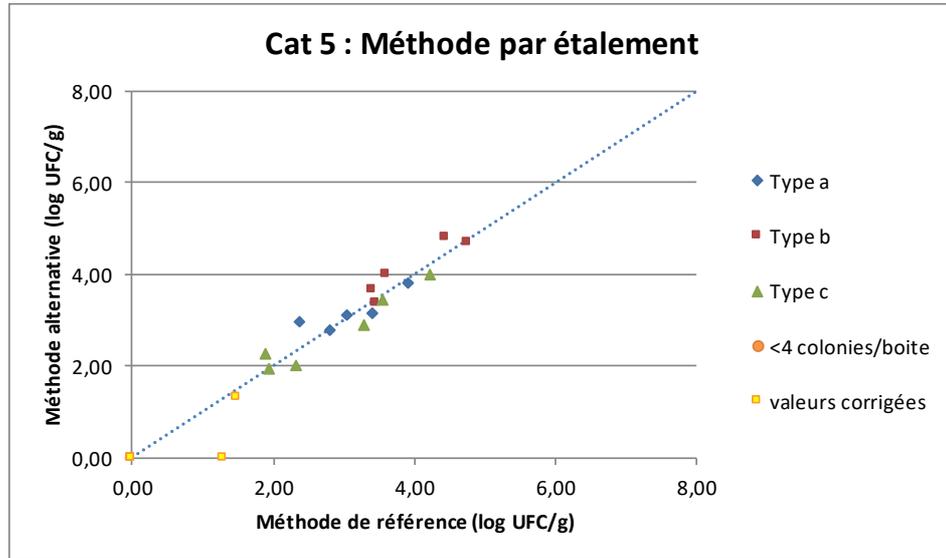

Figure 18 - Data plotted for
Animal feed

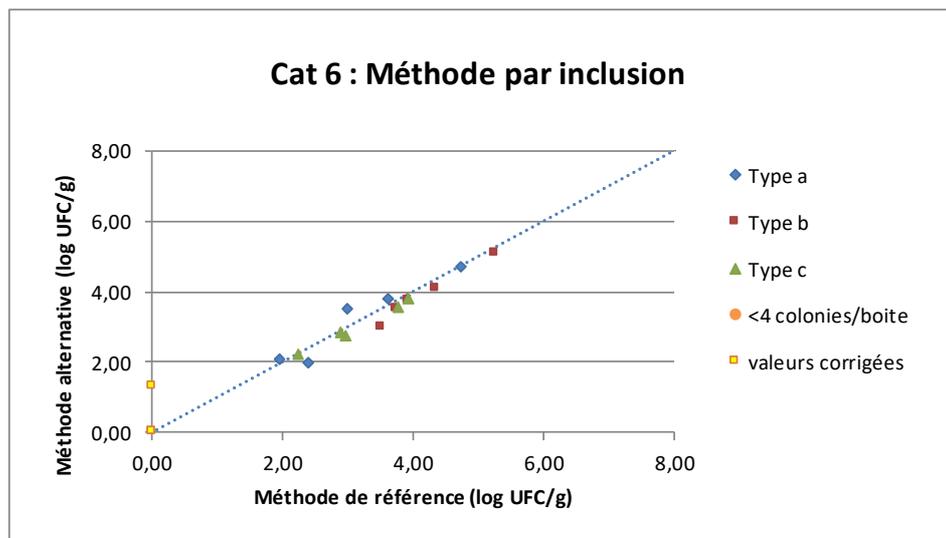

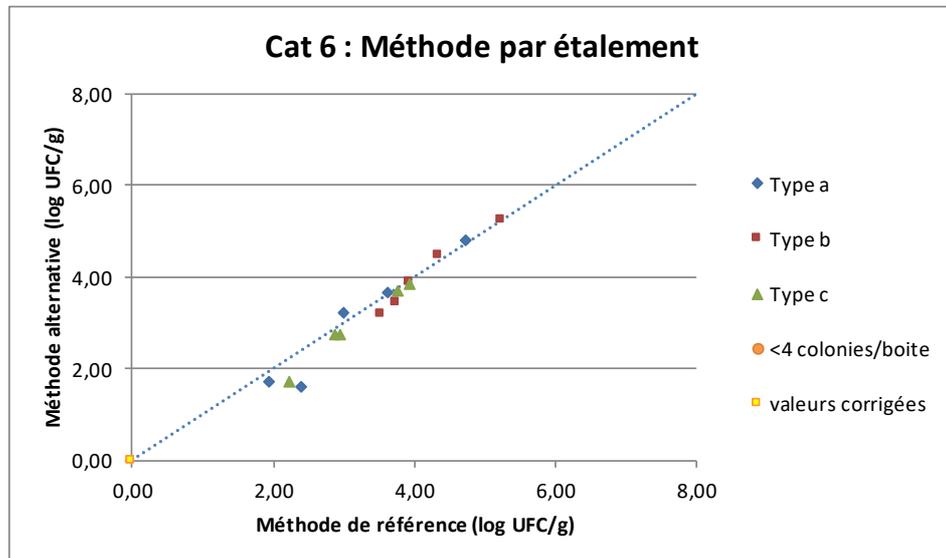

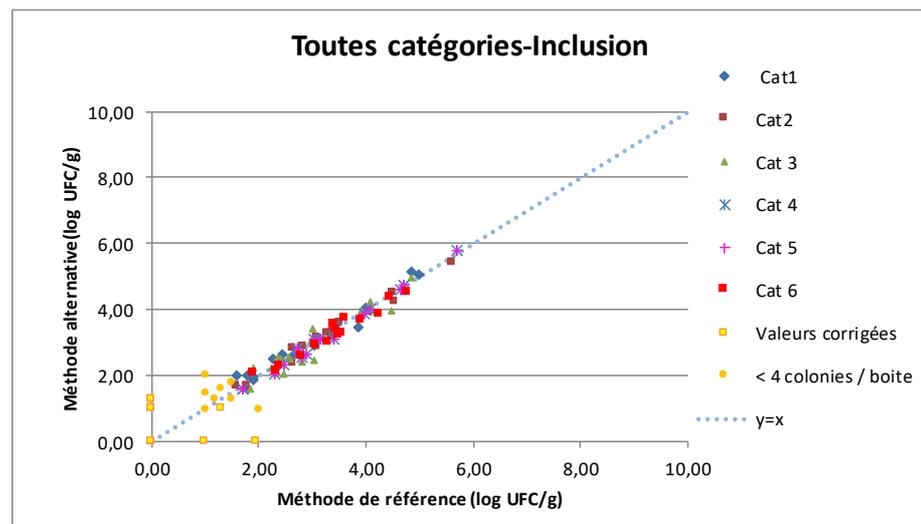

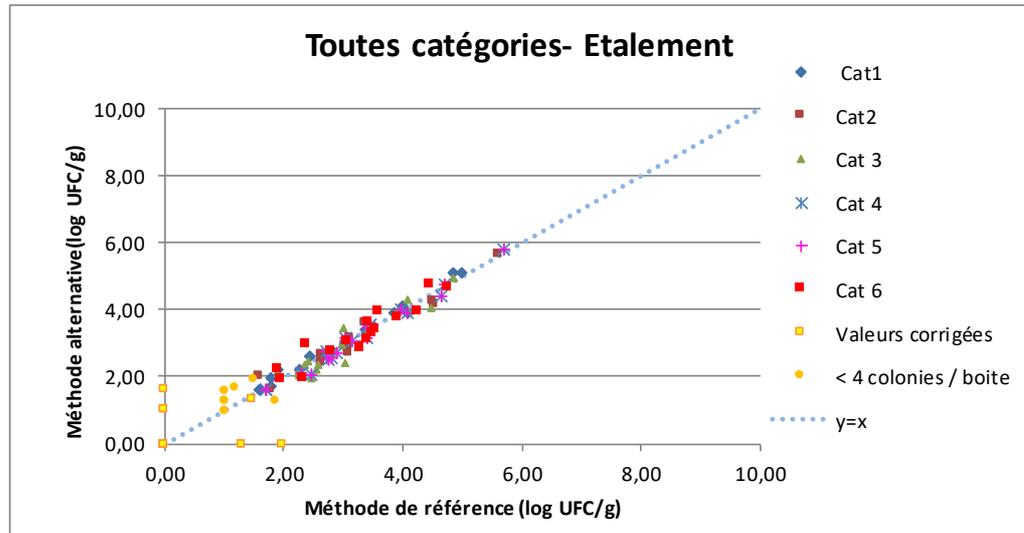

Figure 19 - Data plotted for
All the categories

The calculated values for Average difference and Standard deviation differences per category and the limits of agreement are provided per category and for all the categories in Table 18.

Table 18 - Calculated values

Protocol	Category	n	\bar{D} : (Bias)	95% lower limit	95% upper limit
Spreading method	1	15	0,07	-0,22	0,36
	2	15	-0,09	-0,61	0,43
	3	18	-0,09	-0,70	0,53
	4	18	-0,09	-0,42	0,24
	5	16	0,03	-0,61	0,67
	6	15	-0,16	-0,73	0,42
	All categories	97	-0,06	-0,53	0,42
Pour plate method	1	15	0,04	-0,42	0,50
	2	15	-0,05	-0,39	0,29
	3	19	-0,04	-0,66	0,58
	4	18	-0,08	-0,36	0,19
	5	15	-0,09	-0,47	0,28
	6	15	-0,12	-0,68	0,43
	All categories	97	-0,06	-0,48	0,36

\bar{D} : Average difference

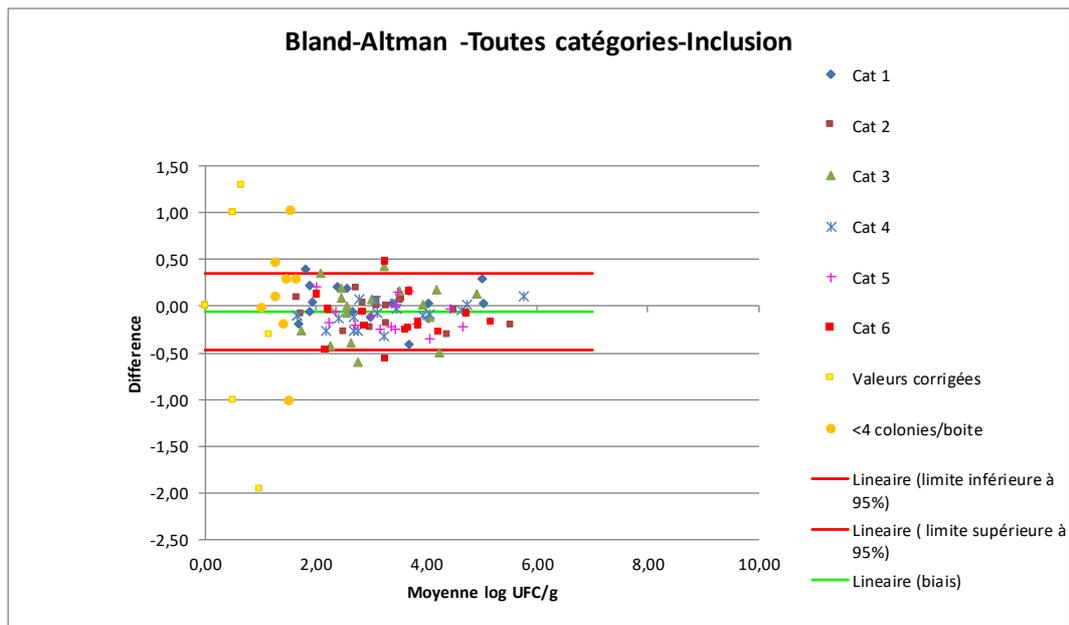

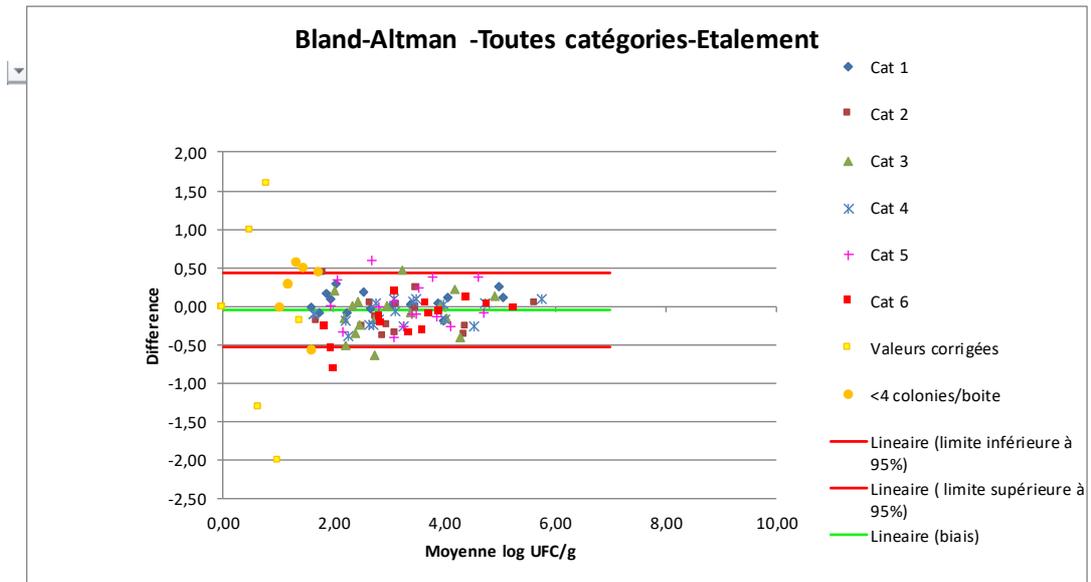

SD: Standard deviation of differences

The bias for all combined categories is - 0.06 log whatever the inoculation procedure used.

The 95% lower limit is - 0.54 log; the 95% upper limit is 0.42 log. The limits are - 0,48 log for the spreading method and 0.36 log for the pour plate method.

The Bland-Altman difference plot for all the samples is given Figure 8.

Figure 20 - Bland-Altman difference plot for
All the categories

Samples for which differences in enumeration were observed are listed by protocol applied for the alternative method (See Table 19).

Table 19 – Results obtained for the samples outside of the limits of agreementValues in **green**: differences in favour of the alternative methodValues in **red**: differences in favour of the reference method

	Corrected value according to ISO 16140-2 :2016 (enumeration lower or upper the quantification limit)
	Results calculated using enumeration lower than 4 CFU/plate

3.2.1.6 Discordant results

The number of samples outside of the limits of agreement is given in Table 20.

Table 20 - Number of samples outside of the limits of agreement

		Alternative method	
		Spreading method	Pour plate method
Interpretable results	< LCL	2	3
	> UCL	5	3
	Total	7	6
<4 CFU/plate	< LCL	1	1
	> UCL	3	2
	Total	4	3
< or quantification limite	< LCL	3	2
	> UCL	3	5
	Total	6	4
Total < LCL		6	6
Total >UCL		11	10
Total		17	16

UCL: 95 % upper confidence limit

LCL : 95 % Lower confidence limit

17 results are outside of the 95% limits of agreement for the spreading method and 16 for the pour plate method. The number of values above the limit of agreement is higher than the number of samples below the limit of agreement.

Note that for four samples (6068, 7218, 7879 et 7880), it was impossible to exploit the results obtained with the reference method due to high level of background microflora on the MYP plates. For these samples, the results were interpretable for the alternative methods for both inoculation procedures, *i.e.* pour plate or spreading methods.

The bias observed between the reference method and the COMPASS *Bacillus* Plus Agar method is closed to 0 for both inoculation procedures.

3.2.1.7 Conclusion

The relative trueness study of the alternative method is satisfying.

3.2.2 Accuracy profile

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and β -expectation tolerance intervals, both reported to different levels of the reference value.

3.2.2.1 Matrices

6 matrices were tested. A minimum of one type per category, and therefore 2 different batches, was selected, using 6 samples per type. 2 samples are contaminated at a low level, 2 at intermediate level, 2 at a high level. For each sample, 5 replicates (5 different test portions) were tested. The tested categories, types, matrix and inoculated strains are provided in Table 21.

Table 21 - Categories, types, matrices and inoculation level

Category	Type	Matrix	Inoculated strain	Origin	Inoculation level (CFU/g)
1 Meat products	a Delicatessen	Pâté	<i>Bacillus cereus</i> Ad2183 (spores)	Ham	100 5000 10000
2 Dairy products	a Milk powders	Milk powder	<i>Bacillus cereus</i> Ad420 (III)	Milk power	
3 Fishery products and egg products	a Fishery products	Saint Jacques terrine	<i>Bacillus weihenstephanensis</i> Ad2478	Raw hulls	
4 Composite products	a Ready to eat	Salad with pastas	<i>Bacillus weihenstephanensis</i> Ad726	Pancake	
5 Cereals, spices, vegetables, fruits and dehydrated vegetables	c Vegetables	Dried puree	<i>Bacillus cytotoxicus</i> Ad2932 (spores) (VII)	Dried puree	
6 Animal feed	c Dehydrated products for pet	Pellet for dog	<i>Bacillus thuringiensis</i> Ad2786	Vegetables	

3.2.2.2 *Calculation and interpretation*

The raw data are provided in **Appendix 13**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 14**. The statistical results and the accuracy profiles are provided Figure 7.

The calculations were done using the AP Calculation Tool MCS available on <http://standards.iso.org/iso/16140>

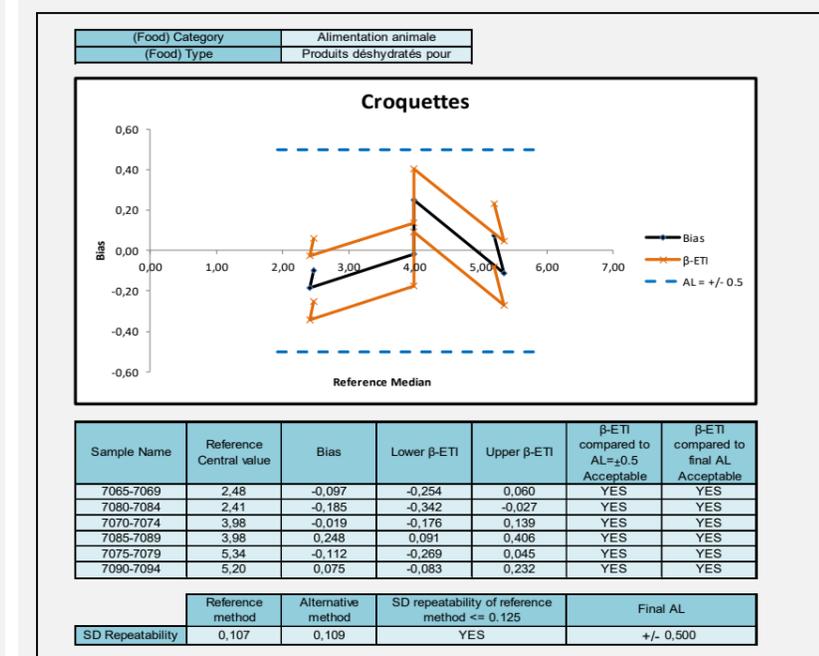

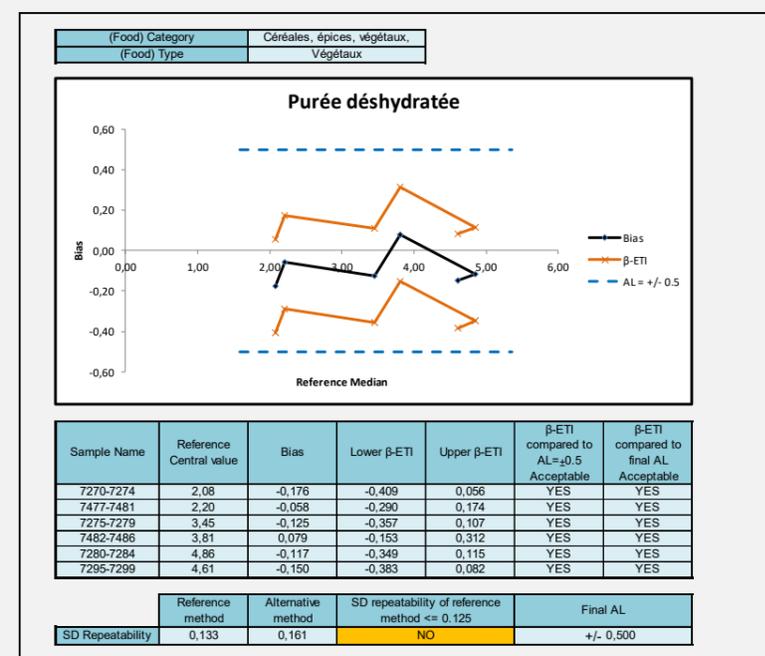

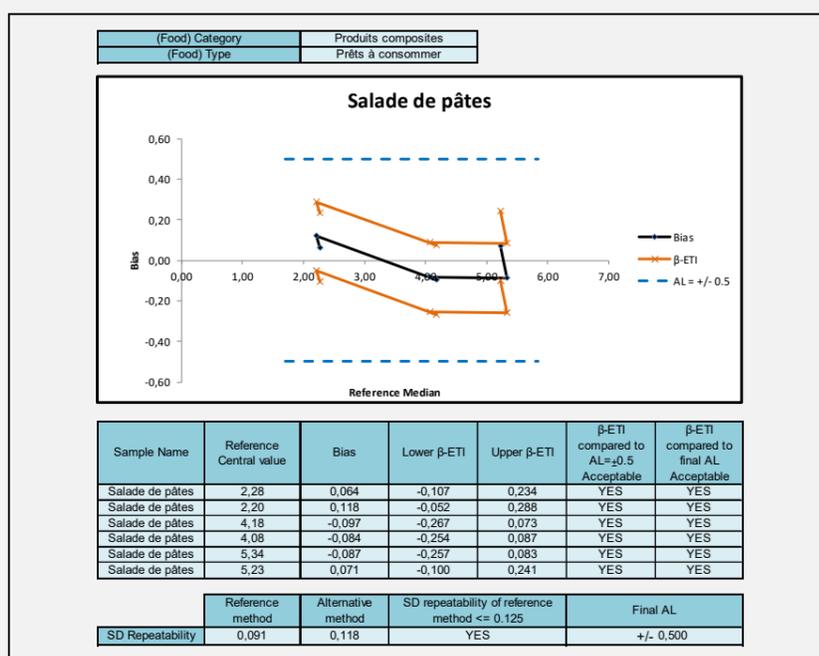

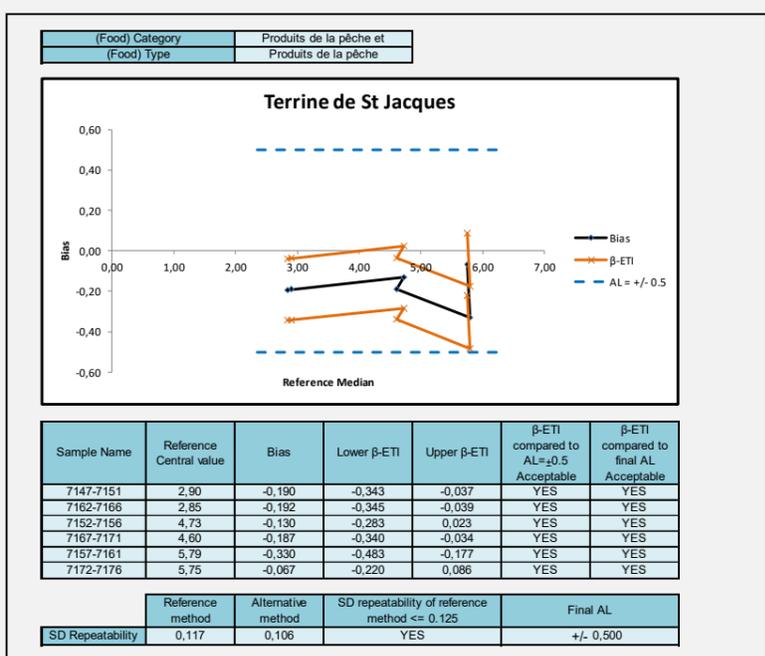

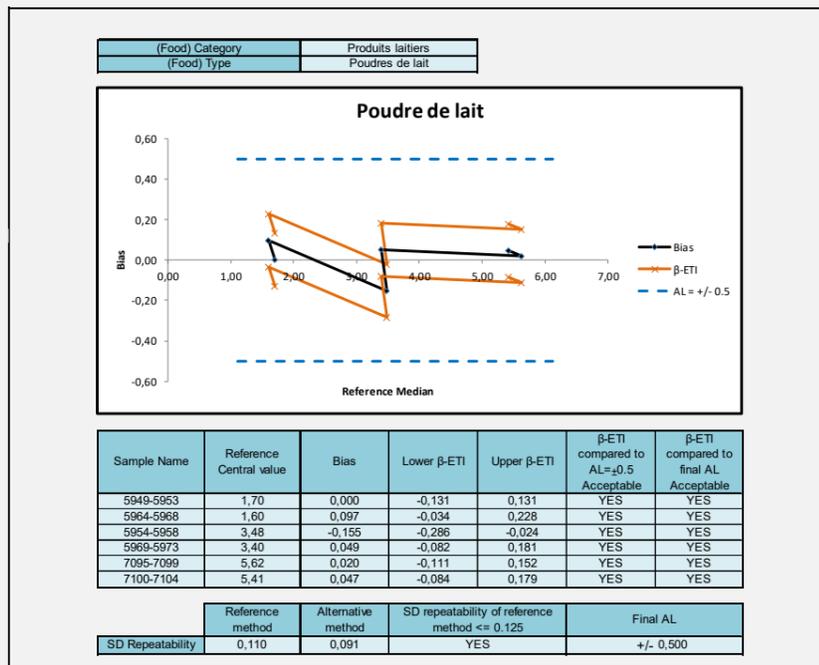

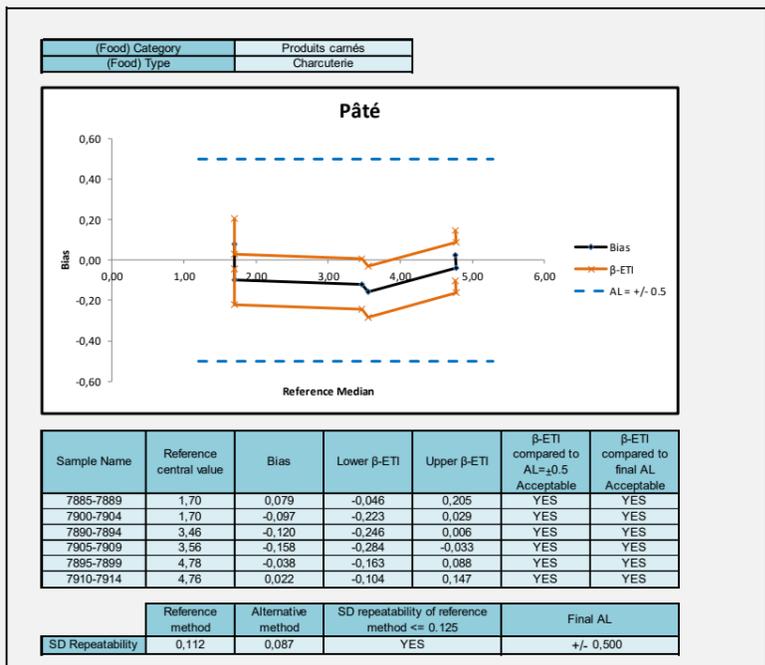

For the six matrices tested and the two inoculation procedures (spreading and pour plate), the accuracy profiles are comprised within the acceptability limits fixed at ± 0.500 log.

3.2.2.3 *Conclusion*

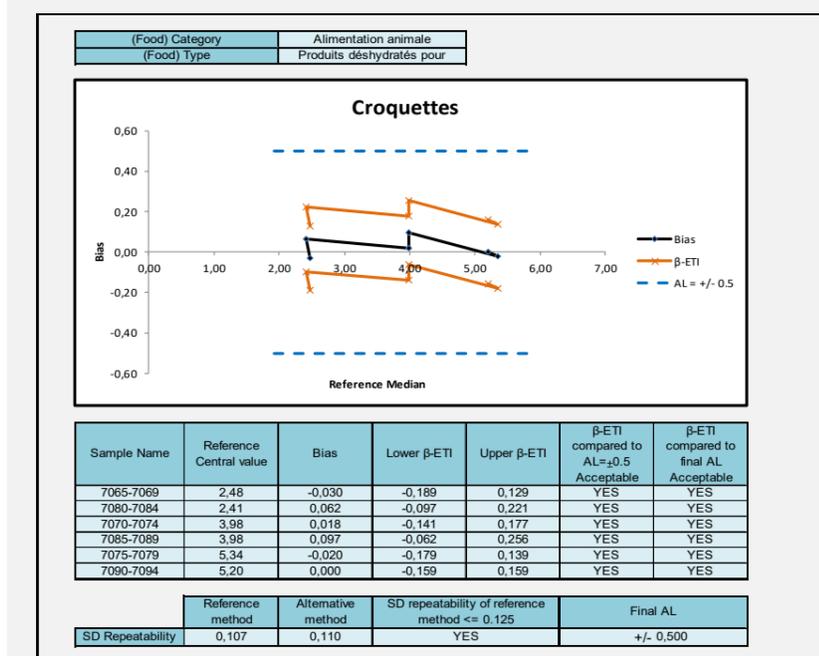

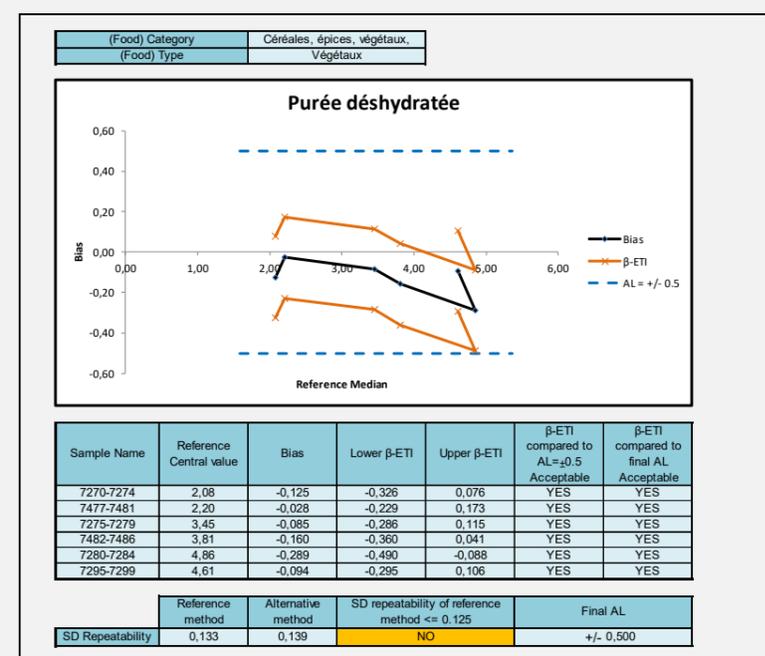

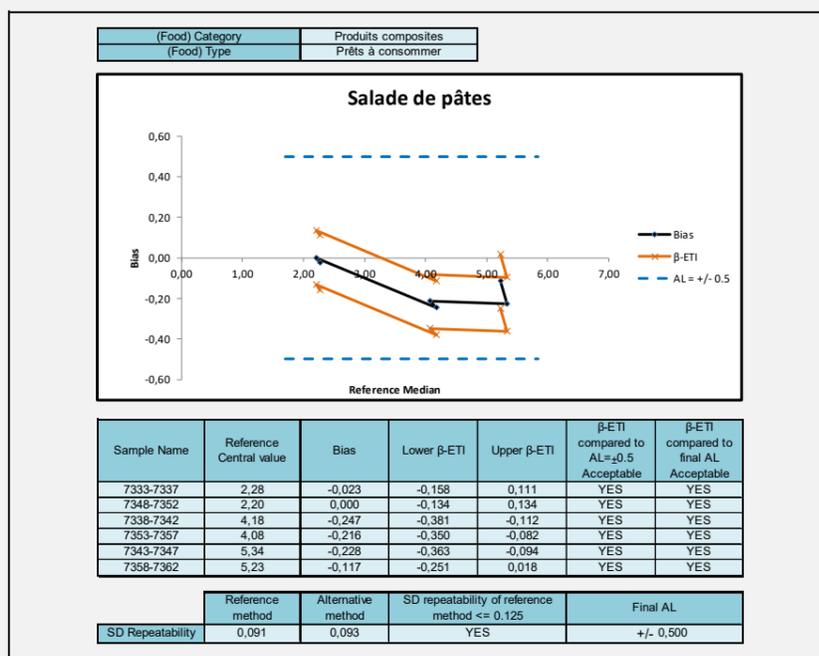

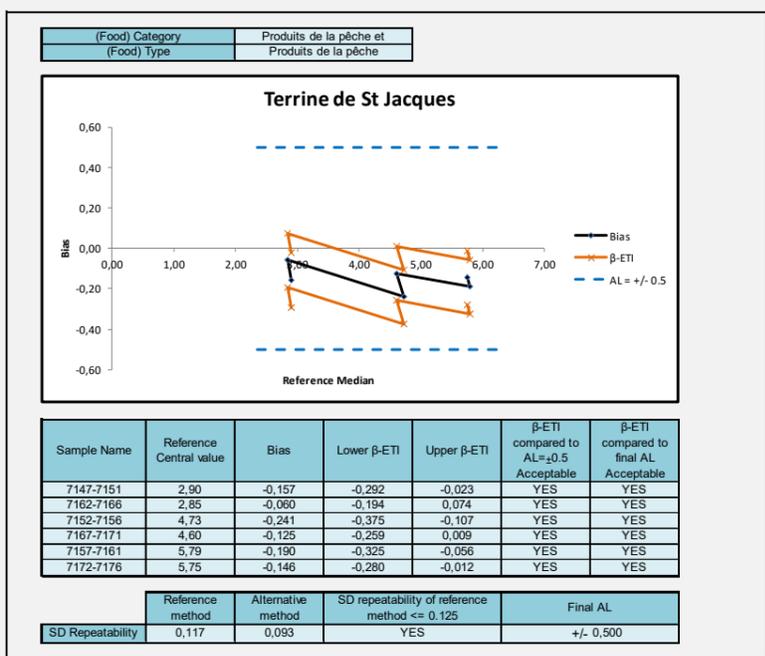

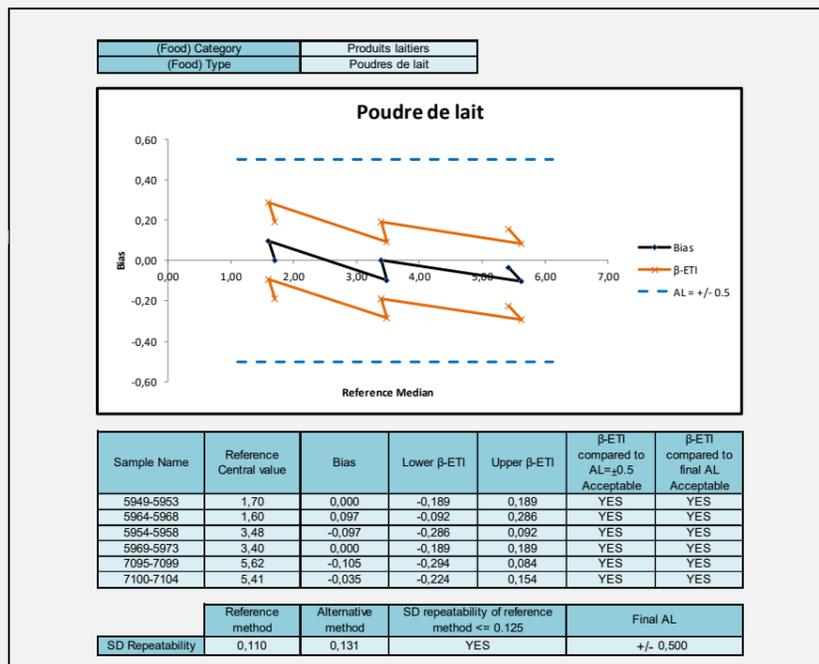

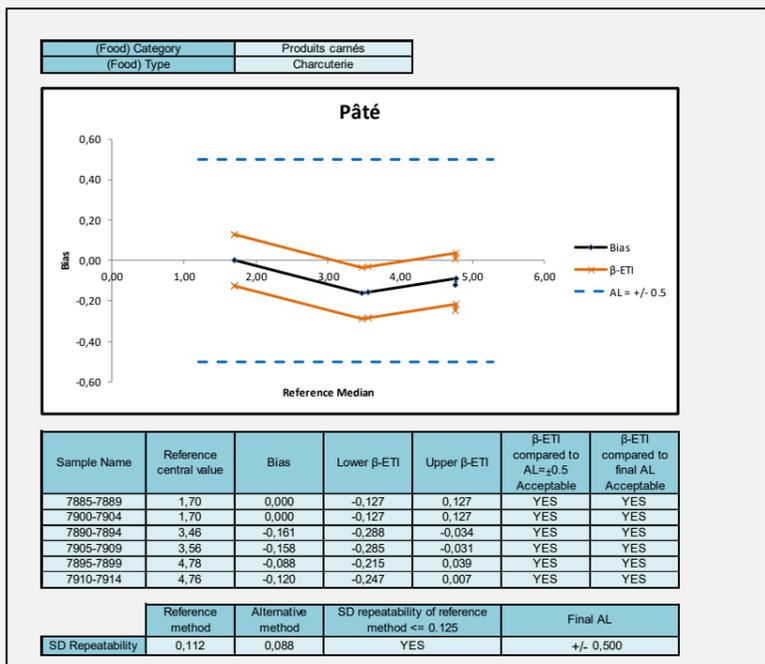

The accuracy profiles are comprised within the acceptability limits for the 6 tested matrices. The observed results are satisfying.

Figure 21 - Accuracy profiles (in French)

Spreading method

Pour plate method

3.2.3 Inklusivity and exclusivity

The inklusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

3.2.3.1 Protocol

50 target strains and 30 non target strains were tested. They were grown in BHI and enumerated with the alternative method (COMPASS *Bacillus* Plus Agar) using the spreading and the pour plate inoculation procedures, with the reference method (MYP plates) and a non-selective agar media (PCA).

3.2.3.2 Results

The raw data of the extension study are given in **Appendix 15**.

Inklusivity

The 50 target strains shown characteristic colonies on the COMPASS® *Bacillus* Plus Agar whatever the inoculation procedure applied.

Note that one strain (*Bacillus thuringiensis* Ad2489) gave a negative haemolysis test when tested from colonies enumerated on MYP plates.

Exclusivity

None of the 30 non-target strains tested shown characteristic colonies neither with the COMPASS® *Bacillus* Plus Agar, nor with the MYP Agar.

3.2.3.3 Conclusion

The alternative method is specific and selective.

3.3 General conclusion

The **conclusions of the method comparison study** are:

- The data observed and the statistical interpretation confirm the performances of the alternative method using either COMPASS Bacillus Agar media or the COMPASS Bacillus Plus Agar media.
- The relative trueness of the method is satisfying.
- The alternative method is specific and selective.
- The accuracy profiles are within the acceptability limits for all the tested matrices. The results are satisfying.

The **conclusions of the interlaboratory study** are:

The data and the interpretation fulfil the ISO 16140-2:2016 requirements. The alternative method, for both formulation of the media, is considered equivalent to the reference method.
