1 INTRODUCTION

The **TEMPO® CAM method** was validated in March 2020 (certificate number BIO 12/43-04/20) for the enumeration of thermotolerant *Campylobacter* in raw poultry and ready-to-cook poultry products according to the ISO 16140-2:2016.

The method was renewed in February 2024.

2 METHOD PROTOCOLS

2.1 Alternative method

The flow diagram of the alternative method is provided in **Appendix 1**.

2.1.1 Principle

The TEMPO® CAM test consists of a vial of culture medium and a card which are specific to this test.

The culture medium is inoculated with the sample to be tested. The inoculated medium is transferred by the TEMPO® Filler instrument into the card containing 48 wells of three different volumes. The card contains 3 sets of 16 wells (small, medium and large wells) with a one log difference in volume for each set of wells. The card is designed to simulate the Most Probable Number (MPN) method. The card is then hermetically sealed in order to avoid any risk of contamination during subsequent handling.

The card is incubated in a microaerobic atmosphere as recommended for *Campylobacter* growth. The microorganisms present in the card reduce the substrate in the culture medium during incubation and cause a fluorescent signal to appear, which is detected by the TEMPO® Reader instrument. Depending on the number and type of the positive wells, the TEMPO® system calculates the number of microorganisms present in the original sample according to a calculation based on the MPN method.

2.1.2 Protocol

- Preparation of primary dilution in Buffered Peptone Water (BPW) in a TEMPO® bag filter;

- Preparation of subsequent dilutions if necessary using BPW;
- Reconstitution of the culture medium (TEMPO® CAM culture medium) by dispensing 3 mL or 3.9 mL of secondary diluent (sterile water) per vial; mix using a vortex;
- Transfer of 1 mL of primary dilution or 0.1 mL of subsequent dilutions into the vial containing the reconstituted culture medium; mix gently without using vortex in order to avoid oxygenation of the media;
- Fill and seal the TEMPO® cards using the TEMPO® Filler;
- Incubation of the cards for 44 - 48 h at 41.5°C ± 1°C in jars in microaerobic atmosphere;
- Read the cards using the TEMPO® Reader. No confirmation is needed.

2.1.3 Restrictions

Campylobacter upsaliensis is excluded from the scope of the validation.

2.2 Reference method♦

The reference method corresponds to the:

- ISO 10272-2 (2017) - Microbiology of the food chain - Horizontal method for detection and enumeration of *Campylobacter* spp. - Part 2: Colony-count technique (See **Appendix 2**).
- ISO 10272-2:2017 / Amd 1: 2023- Microbiology of the food chain - Horizontal method for detection and enumeration of *Campylobacter* spp. - Part 2: Colony-count technique – Amendment 1: Inclusion of methods for molecular confirmation and identification of thermotolerant *Campylobacter* spp. and correction of the performance testing of the media

Changes linked to this Amendment are considered as minor and thus with no impact on the alternative method validations.

3 METHOD COMPARISON STUDY

The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.

The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.

For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.

3.1 Relative trueness study

The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.

3.1.1 Number and nature of the samples

One food category was tested. The repartition per type is provided in **Table 1**.

Table 1 – Category and types

Category	Type	Number of analysed samples	Number of interpretable results
Raw poultry and ready-to-cook poultry products	Raw non-processed poultry meat	12	5
	Poultry neck skin	12	6
	Seasoned poultry	9	6
Total		33	17

33 samples were analysed, leading to 17 exploitable results by both methods. The TEMPO Cards were read after 44 h incubation time at 41.5°C, stored for 48 h at 5°C ± 3°C and read again.

3.1.2 Artificial and natural contamination of the samples

Artificial contaminations were realized by seeding protocols. The inoculated strains, the contamination protocols, the injured protocols of the inoculated cells are provided in **Appendix 3**.

5 samples were naturally contaminated, and 12 samples were artificially contaminated, they all gave interpretable results.

29.4 % of the samples giving exploitable results by both methods were naturally contaminated.

3.1.3 Raw data

The raw data are provided in **Appendix 4**.

The samples were analysed by the reference and the alternative methods in order to have 15 interpretable results per incubation protocol, and 5 interpretable results per tested type.

The data are classified in four categories (See **Table 2**):

- Interpretable results with the reference and the alternative methods.
- Results with less than 4 colonies per plate with the reference (indicated with "*" in the data) in order to have a more precise result. These results are not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1 \log_{10} units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amended by adding 1 log unit. These results are not included in the calculations but also appear on the graphs.
- Samples with no result (ND).

Table 2 - Classification of the data

Category	Type	Number of samples analysed	Number of samples with <4 CFU/plate	Number of samples below or above the detection limit	Number of samples with interpretable results
Raw poultry and ready-to-cook poultry products	a	Raw non-processed poultry meat	12	0	7
	b	Poultry neck skin	12	3	3
	c	Seasoned poultry	9	0	3
Total		33	3	13	17

The samples, which were not used in the calculations, are provided in **Table 3**.

Table 3 - Samples which were not used in the calculations

Year of analysis	N° Sample	Product	ISO 10272-2*	TEMPO CAM 44 h at 41.5°C	TEMPO CAM 44 h at 41.5°C + 48 h 5°C	Type
			Log CFU/g	Log CFU/g	Log CFU/g	
2019	4984	Raw cockerel	1,30*	<1,00	<1,00	a
2019	4985	Raw guinea fowl fillet	<1,00	1,85	1,85	a
2019	4986	Raw chicken garlic	<1,00	<1,00	<1,00	a
2019	4987	Raw guinea fowl leg	<1,00	<1,00	<1,00	a
2019	4988	Raw turkey cutlet	<1,00	<1,00	<1,00	a
2019	4989	Turkey brochette	<1,00	<1,00	<1,00	a
2019	4990	Minced turkey	<1,00	1,00	1,00	a
2019	5625	Chicken neck skin	<2,00	2,08	2,08	b
2019	5626	Chicken neck skin	1,48*	2,00	2,28	b
2019	5627	Chicken neck skin	1,48*	1,52	1,65	b
2019	5628	Chicken neck skin	<1,00	<1,00	1,00	b
2019	5629	Chicken neck skin	1,30*	1,64	1,93	b
2019	5750	Pigeon neck skin	<1,00	<1,00	<1,00	b
2019	4991	Seasoned chicken leg	<1,00	<1,00	<1,00	c
2019	4992	Marinated chicken	<1,00	<1,00	<1,00	c
2019	4993	Seasoned minced duck	<1,00	<1,00	<1,00	c

*: results obtained with less than 4 colonies on the plate

3.1.4 Statistical interpretation

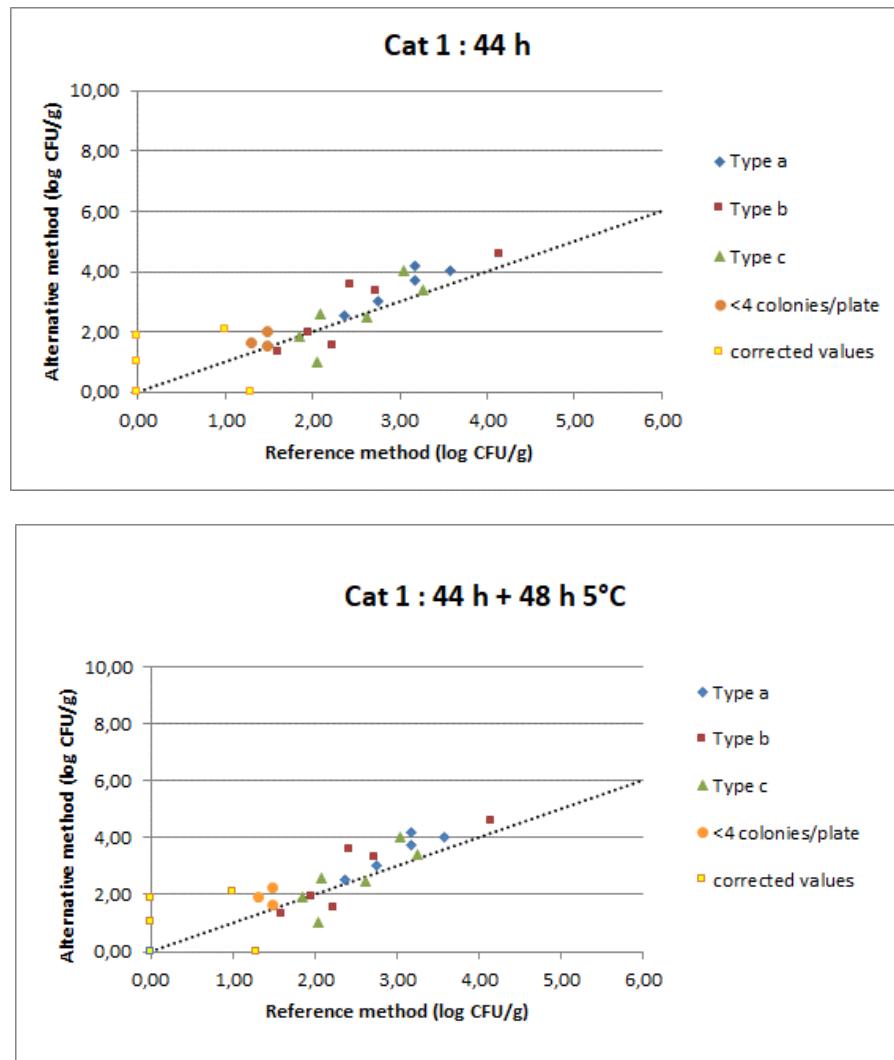

The calculations are provided in **Appendix 5**.

The obtained data were analysed using the scatter plot. The graphs are provided with the line of identity ($y = x$).

The **Figure 1** shows the data plotted for the Raw poultry and ready-to-cook poultry products category after incubation of the cards and after storage of the cards for 48 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$.

• Analyses performed according to the COFRAC accreditation

**Figure 1 - Data plotted for the
Raw poultry and ready-to-cook poultry products**

The calculated values for Average difference and Standard deviation differences per category are provided in **Table 4**.

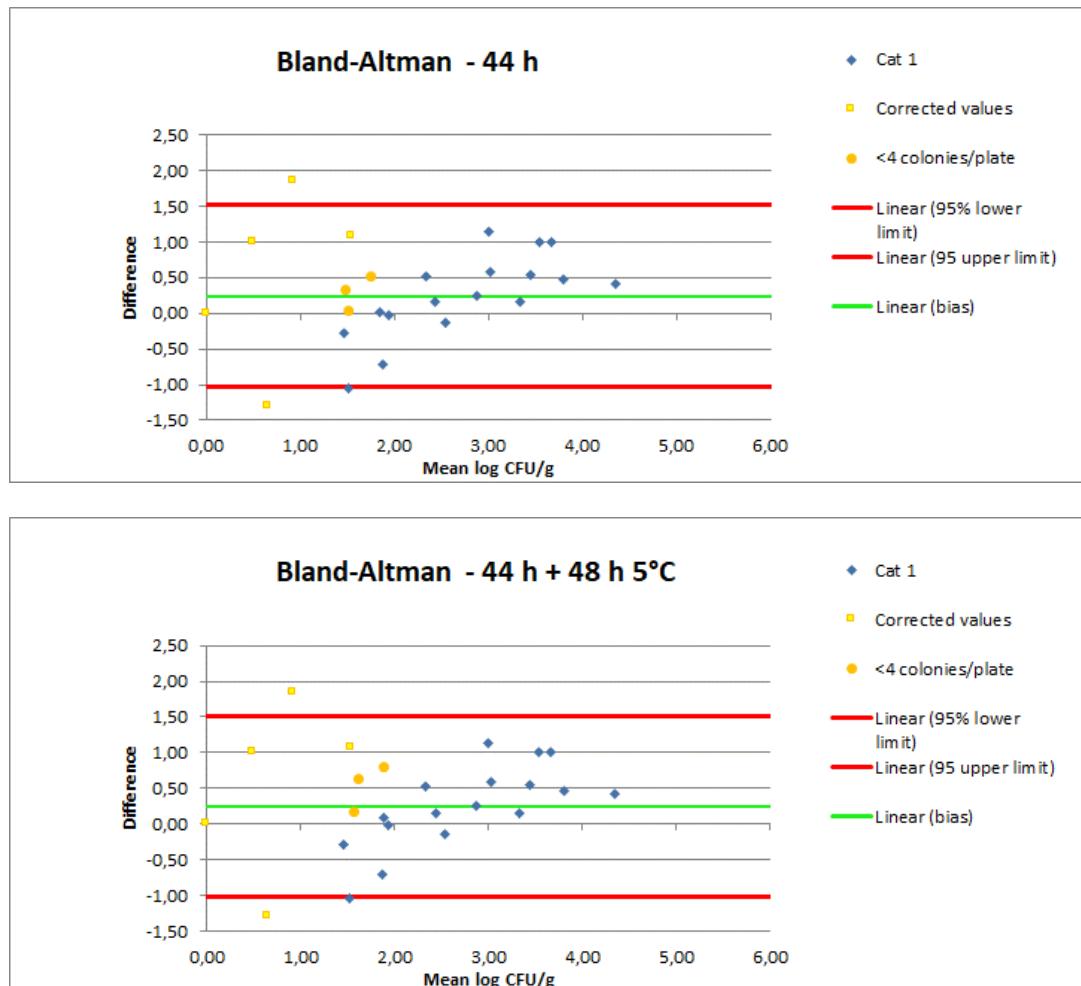

Table 4 - Calculated values

Category		Incubation time	n	\bar{D}	SD	95% lower limit	95% upper limit
1	Raw poultry and ready to cook poultry products	44 h at 41.5°C	17	0,24	0,58	-1,03	1,51
		44 h at 41.5°C + 48 h 5°C	17	0,24	0,58	-1,02	1,51

\bar{D} : Average difference

SD: Standard deviation of differences

The Bland-Altman difference plot for all the samples is given **Figure 2**.

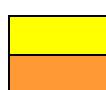

Figure 2 – Bland-Altman difference plot

Samples for which the difference between the result observed with the reference and the alternative methods is above or lower than the limits are listed in **Table 5**.

Table 5 - Analysis of the data out of the confidence limits

Values in green: differences in favour of the alternative method
 Values in red: differences in favour of the reference method

TEMPO CAM for 44 h at 41.5°C and for 44 h at 41.5°C + 48 h at 5°C ± 3°C										
Classification of the data	Category	Type	N° Sample	Product	Reference method	Alternative method	Values before correction (Reference or/and alternative method)	Mean	Difference	LCL / UCL
< or > quantification limit	1	a	4984	Raw cockerel	1,30	0,00	1,00	0,65	-1,30	-1,03 / 1,51
		a	4985	Raw guinea fowl fillet	0,00	1,85	1,00	0,93	1,85	

Corrected value

Results calculated using enumeration lower than 4 CFU/plate

UCL Upper confidence limit

LCL Lower confidence limit

3.1.5 Discordant results

The number of samples outside the 95 % confidence limit is given in **Table 6**.

Table 6 - Number of samples outside the 95 % Confidence Limit

	Number of samples	
	44 h	44 h + 48 h
Interpretable results by both methods	< LCL	0
	> UCL	0
	Total	0
<4 CFU/plate	< LCL	0
	> UCL	0
	Total	0
< or > the quantification limit	< LCL	1
	> UCL	1
	Total	2
Total < LCL	1	1
Total >UCL	1	1
Total	2	2

For some samples, enumeration differences were observed between the reference and the TEMPO CAM methods. The samples concerned are listed in **Table 7**.

Table 7 – Samples with discordant results

N° sample	Product	ISO 10272-2*	TEMPO CAM
4985	Raw guinea fowl fillet	<1,00	1,85
5563	Guinea fowl leg	3,18	4,18
5567	Chicken pieces meat with paprika	3,04	4,04
5631	Chicken neck skin	2,73	3,32
5751	Quail neck skin	2,43	3,57
5625	Chicken neck skin	<2,00	2,08

In order to confirm that the positive results were linked to the presence of *Campylobacter* strains in the wells, a VIDAS CAM test was performed on each of the positive well in the TEMPO card. Presence of *Campylobacter* was confirmed in all the wells except for sample 4985 (confirmation done more than 2 months after the enumeration) indicating that the TEMPO CAM better recovered the *Campylobacter* strains.

3.1.6 Conclusion

The relative trueness study of the alternative method is satisfying.

3.2 Accuracy profile study

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and β -expectation tolerance intervals, both reported to different levels of the reference value.

3.2.1 Matrices

One matrix was tested with three contamination levels and five test portions per level. The tested category, type, matrix and inoculated strain are provided in **Table 8**.

Table 8 – Category, type and matrix

Category	Type	Matrix	Strain	Target inoculation level (CFU/g)
Raw poultry and ready-to-cook poultry products	a	Chicken breast	<i>Campylobacter jejuni</i> Ad1015	100
				1000
				10000

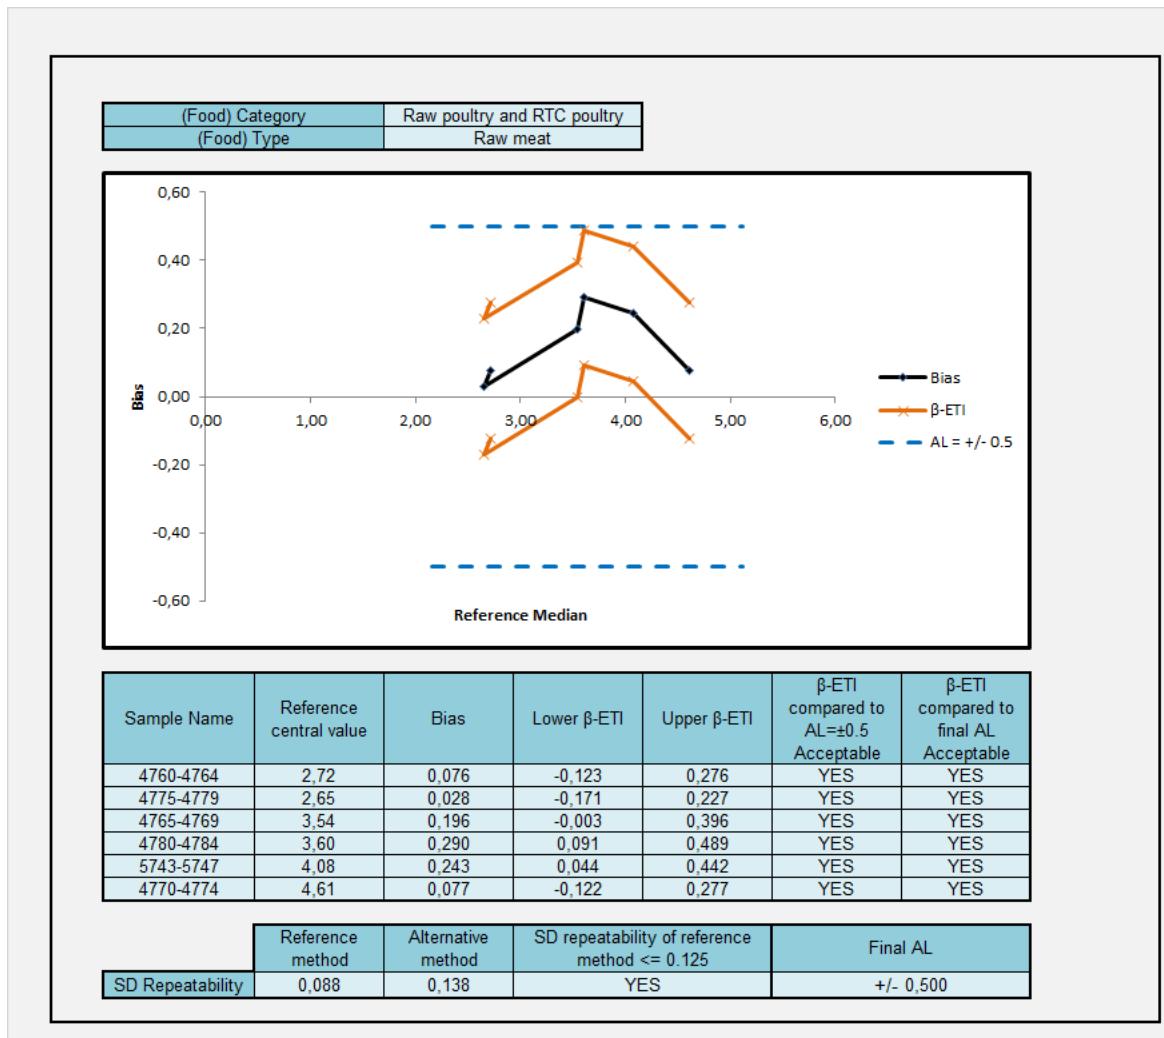

* Analyses performed according to the COFRAC accreditation

3.2.2 Calculation and interpretation

The raw data are provided in **Appendix 6**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 7**. The statistical results and the accuracy profiles are provided **Figure 3**.

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 2027-01-2015 available on <http://standards.iso.org/iso/16140>

Figure 3 – Accuracy profile

3.2.3 Conclusion

The observed profile is comprised within the AL. The accuracy profile fulfils the performance criteria.

3.3 Quantification limits (LOQ)

The limit of Quantification (LOQ) is the lowest analyte concentration that can be quantified with an acceptable level of precision and trueness under the conditions of the test.

The LOQ was determined as is it needed for the instrumental methods which are related to the growth of the microorganism.

3.3.1 Experimental design

Blank samples were tested for chicken breast (same matrix as used for the accuracy profile). These blank samples were used to verify the limit of quantification of the alternative method. 10 test portions from the same sample were analysed.

3.3.2 Calculation and interpretation

The threshold standard deviation S_0 was calculated as followed:

$$s_0 = \frac{1}{n-1} \sum_{j=1}^n (y_j - \bar{y})^2$$

where:

n = the total number of test portions used

y_j = the log transformed result of test portion j

\bar{y} = the average log transformed result of all test portions

The limit of quantification is calculated as $LOQ = 10 s_0$.

3.3.3 Results

Raw data and calculation are provided in **Appendix 8**. The results are summarized in Table 9.

Table 9 - Quantification limits per tested matrix

Matrix	S_0	LOQ
Chicken breast	0	0

3.4 Inclusivity and exclusivity studies

The inclusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

3.4.1 Protocol

After growth according to appropriate conditions (CFB broth 20 h to 24 h at 41.5°C in microaerobic atmosphere for target strains), decimal dilutions were realised and enumerated once by the TEMPO® CAM method, onto mCCDA plates and onto Columbia Blood Agar plates or appropriate non-selective agar plate for non-target strains.

3.4.2 Results

The raw data are provided in **Appendix 9**.

> Inclusivity

The 50 target strains were enumerated with the TEMPO® CAM method giving generally higher enumeration than with CBA (Columbia Blood Agar) and mCCDA plates. The recovery of the *Campylobacter* cells seems better with TEMPO® CAM than onto plates.

> Exclusivity

30 non-target strains were tested. One strain was enumerated with the TEMPO® CAM method: *Ralstonia mannitolityca* Ad1059.

Two other strains have been tested: *Ralstonia mannitolityca* DSM17512 was also enumerated with the TEMPO® CAM method but not the strain *Ralstonia sp.* Ad2504.

3.5 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

Storage conditions, shelf-life and modalities of utilisation after first use	The storage temperatures are between 2 and 25°C (room temperature before analysis) depending on the materials and the reagents.		
Time to result	Steps	Reference method	Alternative method
Negative samples			
Sampling	Day 0	Day 0	
Reading	Day 2	Day 2	
Presumptive positive or positive results			
Sampling	Day 0	Day 0	
Reading	Day 2	Day 2	
Confirmation	Day 5 - Day 6	/	
Common step with the reference method	Initial suspension		

The results are available in 2 days with the TEMPO® CAM method (positive and negative). The negative results are available in 2 days for negative samples with the reference method and in 5 - 6 days for the presumptive and positive results.

4 INTER-LABORATORY STUDY

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

4.1 Study organisation

Samples were sent to 13 laboratories; 2 collaborators were involved in two labs (A and F). Minced poultry meat was inoculated by *Campylobacter jejuni* Ad1000, isolated from poultry.

Samples were prepared and inoculated on Monday 20th January 2020, as described below:

- 7 minced poultry meat codified samples (10 g) for enumeration of *Campylobacter* spp. by the ISO 10272-2 reference method and TEMPO CAM method,
- 1 sample 10 g (labelled “Sample for Total Count enumeration”) for Aerobic mesophilic flora enumeration by the ISO 4833-1 method,
- 1 water flask labelled “Temperature Control” with a temperature probe.

The targeted inoculation levels were the following:

- Level 0: < 10 CFU/g,
- Level 1: 100 - 1000 CFU/g,
- Level 2: 1000 – 10000 CFU/g,
- Level 3: 10000 – 100000 CFU/g.

Labelling and shipping

Blind coded samples were placed in isothermal boxes, which contained cooling blocks, and express-shipped to the different laboratories.

A temperature control flask containing a sensor was added to the package in order to register the temperature profile during the transport, and storage until analyses.

Samples were shipped in 24 h to the involved laboratories. The temperature conditions had to stay lower or equal to 8°C during transport, and between 0°C and 8°C in the labs.

Collaborative study laboratories and the expert laboratory carried out the analyses on Wednesday 22nd January 2020 with the alternative and reference methods. **The analyses by the reference method and the alternative method were performed on the same day.**

4.2 Experimental parameters controls

4.2.1 Sample stability

In order to evaluate the *Campylobacter jejuni* strain behaviour during transport, bacterial counts were done at different time, i.e. inoculation time, after 24 h and 48 h of storage at 2°C. Results are reported in **Table 10**.

Table 10 – Stability of the strain in the matrix

Day of analysis	Inoculation level	Reference method: ISO 10272-2	Alternative method: TEMPO CAM
Day 0	Level 1	1400	810
		1100	2300
		1100	1200
	Level 2	12 000	15000
		11 000	12000
		10 000	21 000
	Level 3	110000	68000
		120000	250000
		150 000	170 000
Day 1	Level 1	1200	900
		920	1000
		870	530
	Level 2	5200	15000
		1900	6000
		6 300	7 800
	Level 3	57000	170000
		62000	91000
		4 2000	50000
Day 2	Level 1	1100	580
		780	640
	Level 2	5100	6000
		8800	6800
	Level 3	120000	40000
		130000	60000

No evolution was observed during 48 h storage at 3°C ± 2°C.

4.2.2 Logistic conditions

The temperatures measured at reception by the Labs, the temperatures registered by the thermo-probe, and the receipt dates are given in **Table 11**.

Table 11 - Sample temperatures at receipt

Collaborators	Temperature measured by the probe (°C)	Temperature measured at receipt (°C)	Receipt date and time		Analysis date
A1	0.0	1.1	21/01/2020	10 h 10	22/01/2020
A2	0.5	1.6	21/01/2020	10 h 10	22/01/2020
B	1.0	1.1	21/01/2020	14 h 00	22/01/2020
C	1.5	5.8	21/01/2020	7 h 25	22/01/2020
D	1.0	1.4	21/01/2020	11 h 30	22/01/2020
E	2.0	2.8	21/01/2020	13 h 00	22/01/2020
F1	1.0	3.0	21/01/2020	9 h 30	22/01/2020
F2	1.0	2.0	21/01/2020	9 h 30	22/01/2020
G	0.5	3.8	21/01/2020	10 h 45	22/01/2020
H	2.0	4.6	21/01/2020	11 h 00	22/01/2020
I	1.5	6.0	21/01/2020	8 h 00	22/01/2020
J	1.0	3.4	21/01/2020	8 h 45	22/01/2020
K	1.5	1.0	21/01/2020	17 h 00	22/01/2020
L	1.5	4.0	21/01/2020	13 h 00	22/01/2020
M	1.0	4.1	21/01/2020	13 h 00	22/01/2020

No problem was encountered during the transport or at receipt for the 15 collaborators. All the samples were delivered on time and in appropriate conditions. Temperatures during shipment and at receipt were all correct.

4.2.3 Homogeneity of inoculation

Homogeneity tests were conducted according to the ISO/TS 22117. Ten samples per inoculation level were analysed in duplicate by the reference method. The results are provided in **Appendix 10**. The test concluded that the samples were sufficiently homogeneous for the three contamination levels.

4.3 Result analysis

The raw data are given in **Appendix 11**.

4.3.1 Aerobic mesophilic enumeration

The aerobic mesophilic enumeration varied from 1.5×10^6 CFU/g (Lab H) to 2.3×10^7 CFU/g (Lab K).

4.3.2 Results obtained by the expert Lab.

The results obtained by the expert Lab. are the following (See **Table 12**).

Table 12 – Results obtained by the expert Lab.

Level	Reference method	Alternative method
L0	< 10	< 10
L1	1100	580
	780	640
L2	5100	6000
	8 800	6 800
L3	120000	40000
	130 000	60 000

The enumeration results correspond to the target inoculation levels.

4.3.3 Results obtained by the collaborators

Samples were sent to 15 collaborators.

A summary of the test results is given in **Table 13** (CFU/g) and **Table 14** (log CFU/g).

Table 13 - Summary of data (CFU/g)

Collaborator	Level 0		Level 1				Level 2				Level 3			
	Reference method	TEMPO CAM method	Reference method		TEMPO CAM method		Reference method		TEMPO CAM method		Reference method		TEMPO CAM method

4.4 Calculation and interpretation

4.4.1 Visual linearity checking

The **Figure 4** shows the data points after \log_{10} transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method. The data are distributed closely to the first bisecting lines with a slope equal to 1.

Figure 4 - Visual linearity checking

The dispersion of the points on the graph is mostly related to the heterogeneity of the results observed with the reference method within an inoculation level, with low enumeration observed for some samples. *Examples:*

- Level 1 (target value: 2.8 log): Sample L5: 2.20 log
- Level 2 (target value: 3.7 log): Sample C1: 3.08 log
Sample C7: 3.04 log
Sample L1: 3.00 log
- Level 3 (target value: 4.7 log): Sample L2: 3.60 log

These data confirm the tendency of the reference method to undercount.

4.4.2 Accuracy profile calculation

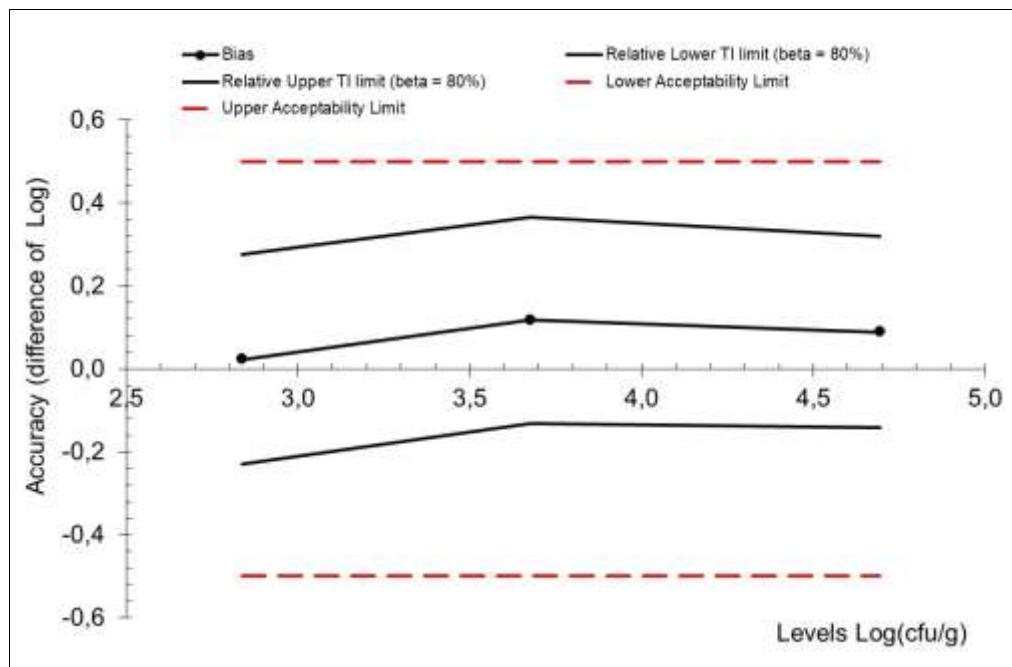

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140>. A summary of the statistical test is provided in **Table 15**.

Table 15 - Summary of statistical tests

Accuracy profile			
Study Name	TEMPO CAM		
Date	January 2020		
Coordinator	ADRIA Développement		
Tolerance probability (beta)	80%	80%	80%
Acceptability limit in log (lambda)	0,50	0,50	0,50
Alternative method			
Levels	Low	Medium	High
Target value	2,838	3,677	4,694
Number of participants (K)	15	15	15
Average for alternative method	2,860	3,794	4,783
Repeatability standard deviation (sr)	0,179	0,181	0,157
Between-labs standard deviation (sL)	0,062	0,048	0,072
Reproducibility standard deviation (sR)	0,189	0,187	0,173
Corrected number of dof	28,418	28,708	27,791
Coverage factor	1,336	1,335	1,338
Interpolated Student t	1,312	1,312	1,313
Tolerance interval standard deviation	0,1928	0,1902	0,1761
Lower TI limit	2,608	3,545	4,552
Upper TI limit	3,113	4,043	5,014
Bias	0,023	0,117	0,089
Relative Lower TI limit (beta = 80%)	-0,230	-0,132	-0,143
Relative Upper TI limit (beta = 80%)	0,276	0,367	0,320
Lower Acceptability Limit	-0,50	-0,50	-0,50
Upper Acceptability Limit	0,50	0,50	0,50
New acceptability limits may be based on reference method pooled variance			
Pooled repro standard dev of reference	0,309		

Application of clause 6.2.3
Step 8: If any of the values for the β -ETI fall outside the acceptability limits, calculate the pooled average reproducibility standard deviation of the reference method.
Step 9: Calculate new acceptability limits as a function of this standard deviation.

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given **Figure 5**.

Figure 5 - Accuracy profile

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of ± 0.5 log.

The alternative method is considered equivalent to the reference method as β ETI values meet the Acceptability limits fixed at ± 0.5 log for all levels of contamination.

A summary of the obtained values is given **Table 16**.

Table 16 – Summary of the obtained values

	Dataset		
	15		
	Low level	Medium level	High level
Target value	2,838	3,677	4,694
Bias	0,023	0,117	0,089
β .ETI lower (80 %)	-0,230	-0,132	-0,143
β .ETI upper (80 %)	0,276	0,367	0,320
Lower AL		-0,500	
Upper AL		0,500	

4.4.3 Conclusion

The alternative method is equivalent to the reference method for all inoculation levels.

5 CONCLUSION

The **method comparison study conclusions** are:

The observed data and interpretation confirm the performances of the alternative method:

- 33 samples were tested in the relative trueness study**, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2; this study confirms the possibility as well to store TEMPO cards for 48 h at $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$.
- The observed profile is comprised within the AL set at 0.5 Log CFU/g in the EN ISO 16140-2:2016.**
- A positive bias (0.24 log CFU/g) was observed compared to the ISO 10272-2 standard, due to a better resuscitation of *Campylobacter*.**
- The inclusivity and exclusivity testing show satisfying results.**

The **inter-laboratory study conclusions** are:

- The quality assurance parameters were verified (i.e. inoculation homogeneity, targeted levels, strain stability, logistic conditions, analyses), confirming that the inter-laboratory study was conducted in appropriate conditions.
- The data interpretations were done according to the EN ISO 16140-2:2016.** For the three contamination levels, the alternative method is accepted as equivalent to the reference method.

Based on the results obtained for the method comparison study and the inter-laboratory study, the TEMPO CAM method is considered equivalent to the reference method.

Quimper, 23 February 2024

Astrid CARIOU

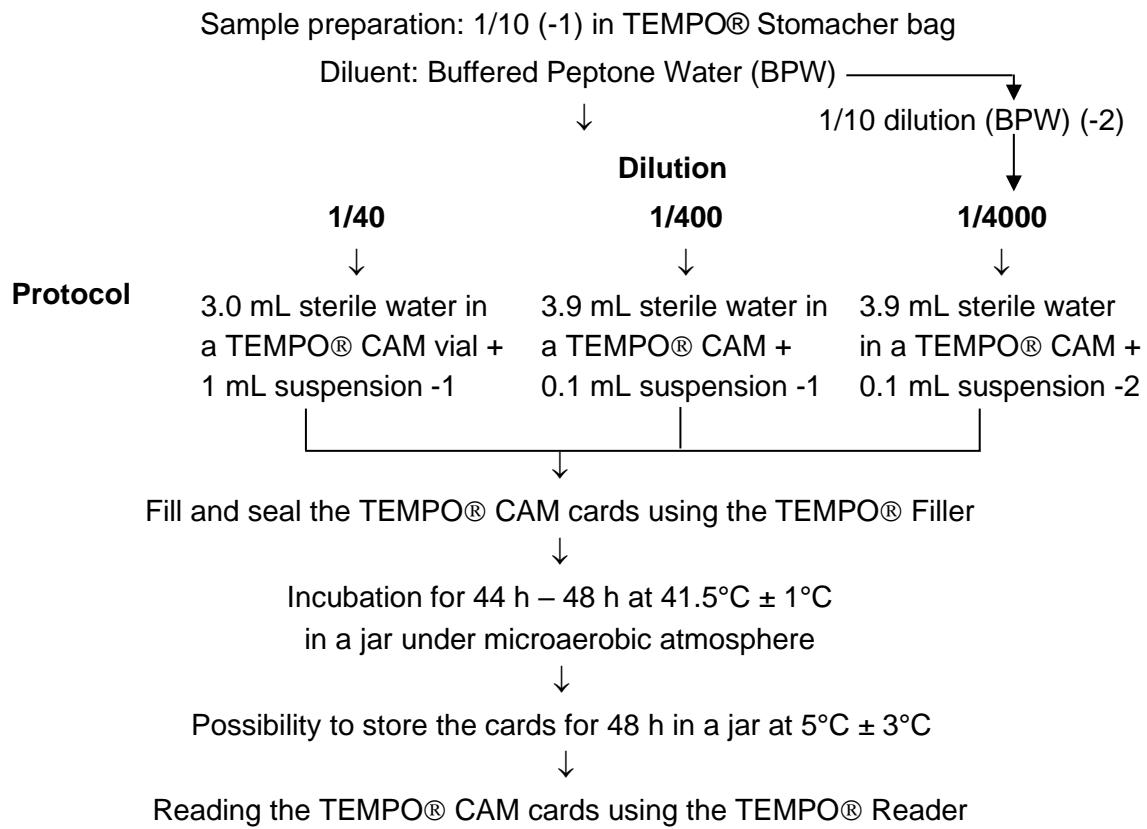

Deputy Manager

Validation of Alternative methods

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

Appendix 1 - Flow diagram of the alternative method: TEMPO® CAM method

The 1/40 dilution allows 10 to 49 000 cfu/g enumeration.

The 1/400 dilution allows 100 to 490 000 cfu/g enumeration.

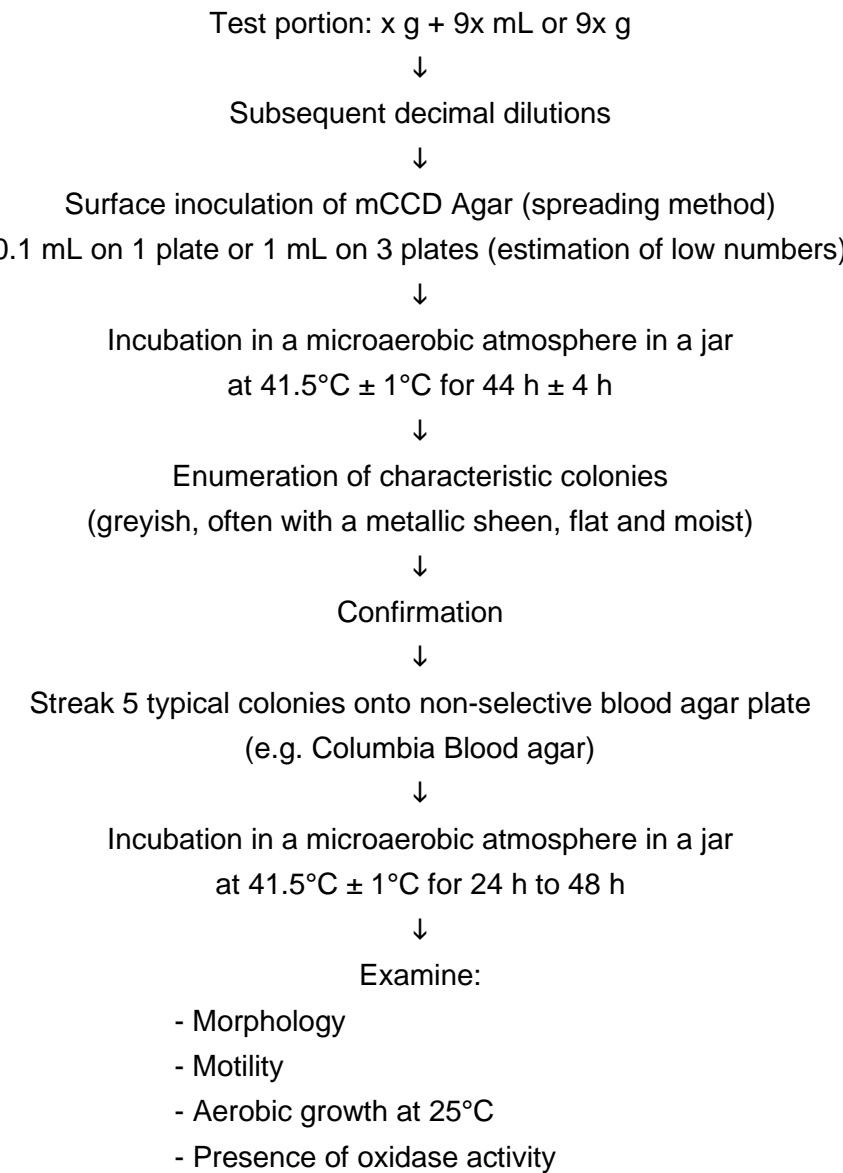

The 1/4000 dilution allows 1 000 to 4 900 000 cfu/g enumeration.

Appendix 2 – Flow diagram of the reference method

ISO 10272-2 (2017) - Microbiology of the food chain - Horizontal method for detection and enumeration of *Campylobacter* spp. - Part 2: Colony-count technique

ISO 10272-2:2017 / Amd 1: 2023- Microbiology of the food chain - Horizontal method for detection and enumeration of *Campylobacter* spp. - Part 2: Colony-count technique

– Amendment 1: Inclusion of methods for molecular confirmation and identification of thermotolerant *Campylobacter* spp. and correction of the performance testing of the media
