## 1 INTRODUCTION

---

The TEMPO® EC method was validated in February 2005 for human food and pet food (Certificate number BIO 12/13-02/05) according to the ISO 16140 (2003) standard.

<b>February 2005</b>	Initial validation study for food and feed products
<b>May 2007</b>	Extension validation for a specific protocol for milk powders including the secondary diluents MOPS buffer instead of distilled water
<b>January 2009</b>	Renewal study
<b>February 2011</b>	Extension study to extend the scope of the validated TEMPO® EC method to raw milks. An accuracy study was run.
<b>November 2012</b>	Renewal study
<b>January 2017</b>	Renewal study according to the NF EN ISO 16140-2:2016
<b>December 2020</b>	Renewal study
<b>April 2023</b>	Extension study for a new protocol for dairy products with incubation of the cards at 44°C

## 2 METHOD PROTOCOLS

---

### 2.1 Alternative method

#### 2.1.1 Principle

TEMPO® system is an automated method associating an innovative card with an adapted medium to ensure rapid enumeration of several quality indicators.

The method is based on the MPN principle (Most Probable Number), with the TEMPO® card.

The TEMPO® EC test consists in a culture medium associated to the TEMPO® card. The culture medium is inoculated with the sample to be tested and transferred by the TEMPO® Filler into the card.

Depending on the number and size of the positive wells, the TEMPO® Reader calculates the number of *E. coli*. Card reading, interpretation and reporting are directly managed by the TEMPO® system.

### 2.1.2 Protocol

The flow diagram of the alternative method is provided in **Appendix 1**.

For all categories (food and pet food):

- Incubation of the TEMPO cards for 24h-27 h at 37°C ± 1°C

For dairy products:

- Incubation of the TEMPO cards for 24h-27 h at 44°C ± 1°C
- Possibility to store the TEMPO cards for 48h at 5°C ± 3°C

### 2.1.3 Restriction

Using the TEMPO® EC method is not recommended to analyse the products with a high enzymatic activity. This restriction concerns particularly the raw mollusc and red offals, which needs a dilution rate >1/40.

## 2.2 Reference method\*

The standard method is the ISO 16649-2 (July 2001): Horizontal method for the enumeration of β glucuronidase positive *Escherichia coli* – Part 2: colony-count technique at 44°C using 5-bromo-4-chloro-3 indoly β-D-glucuronate.

The protocol of the reference method is given in **Appendix 2**.

## 2.3 Protocols applied during the validation studies

For the initial validation study (2005) and extensions performed in 2007 and 2011, the TEMPO cards were incubated for 24h at 37°C ± 1°C. For the extension study which concerns the dairy products category (2023), the TEMPO cards were incubated for 24 h at 44°C and read again after storage for 48h at 5°C ± 3°C.

---

\* Analysis performed according to the COFRAC accreditation

### 3 INITIAL VALIDATION STUDY, EXTENSION/RENEWAL STUDIES: RESULTS

---

#### 3.1 Method comparison study

**The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.**

*The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.*

*For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.*

##### 3.1.1 Relative trueness

*The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.*

###### 3.1.1.1 Number and nature of the samples

The following samples were analysed:

Year	Number of samples analysed	Study
2004	73	Initial validation study
2006	30	Extension study for a specific protocol dedicated to milk powders
2010	19	Extension study for raw milks
2011	52	Data for bioMérieux (complementary data: meat products and composite foods)
2016	16	Renewal study

In 2004, 2006 and 2010, the analyses were realised in duplicate according to the ISO 16140 (2003).

A total of 190 samples were analysed providing 141 interpretable results. The number of samples tested per category and type is presented in table 1.

**Table 1 - Number and nature of the samples**

Category	Type	Number of samples analysed	Number of samples with interpretable results
1	RTE & RTRH products	a Ready to eat	10
		b Ready to reheat	9
		c Cooked delicatessen	5
		Total	24
2	Meat products	a Raw meat, except poultry meat	7
		b Raw poultry meat	11
		c Delicatessen (to cook)	11
		Total	29
3	Dairy products	a Cheeses and ice creams	8
		b Milk powders	30
		c Raw milk	19
		Total	57
4	Seafood products	a Raw	13
		b Ready to reheat	5
		c Smoked	5
		Total	23
5	Fruits and vegetables	a Raw, non-processed	12
		b Ready to eat	16
		c Ready to reheat	12
		Total	40
6	Pet food	a Raw	5
		b Sausages, pâtés	6
		c Pellets	6
		Total	17
ALL CATEGORIES		190	141

### 3.1.1.2 Artificial and natural contamination of the samples

Naturally contaminated samples were analysed preferably. Artificially contaminated samples, using spiking or seeding protocols, were also analysed. The inoculated strains and the contamination protocols are provided in **Appendix 3**.

Among the interpretable results, 64 samples were naturally contaminated, and 77 samples were artificially contaminated.

Note that all the artificially contaminated samples are indicated in bold typing all among the report.

### 3.1.1.3 Raw data

The raw data are provided in **Appendix 4**.

The samples were analysed by the reference and the alternative methods in order to have 15 interpretable results per category, and 5 interpretable results per tested type.

The data are classified in three categories (See Table 2):

- Interpretable results with the reference and the alternative methods.
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with “\*” in the data) in order to have a more precise result. These results are not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1  $\log_{10}$  units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amended by adding 1 log unit. These results are not included in the calculations but also appear on the graphs.

**Table 2 - Classification of the data**

Category		Type	Number of samples analysed	Number of samples with < 4 CFU/plate	Number of samples below or above the detection limit	Number of samples with no result	Number of samples with interpretable results
1	RTE & RTRH products	a Ready to eat	10	0	0	0	9
		b Ready to reheat	9	0	1	0	7
		c Cooked delicatessen	5	0	2	0	5
		Total	24	0	3	0	21
2	Meat products	a Raw meat, except poultry meat	7	0	0	0	7
		b Raw poultry meat	11	0	0	0	11
		c Delicatessen (to cook)	11	0	1	0	10
		Total	29	0	1	0	28
3	Dairy products	a Cheeses and ice creams	8	1	1	0	6
		b Milk powders	30	3	3	1	23
		c Raw milk	19	2	7	0	10
		Total	57	6	11	1	39
4	Seafood products	a Raw	13	0	7	1	5
		b Ready to reheat	5	0	0	0	5
		c Smoked	5	0	0	0	5
		Total	23	0	7	1	15
5	Fruits and vegetables	a Raw, non-processed	12	0	7	0	5
		b Ready to eat	16	1	5	0	10
		c Ready to reheat	12	0	4	0	8
		Total	40	1	16	0	23
6	Pet food	a Raw	5	0	1	0	5
		b Sausages, pâtés	6	0	1	0	5
		c Pellets	6	0	0	0	5
		Total	17	0	2	0	15
ALL CATEGORIES			190	7	40	2	141

The samples, which were not used in the calculations, are provided in Table 3.

**Table 3 - Samples, which were not used in the calculations**

• Analyses performed according to the COFRAC accreditation

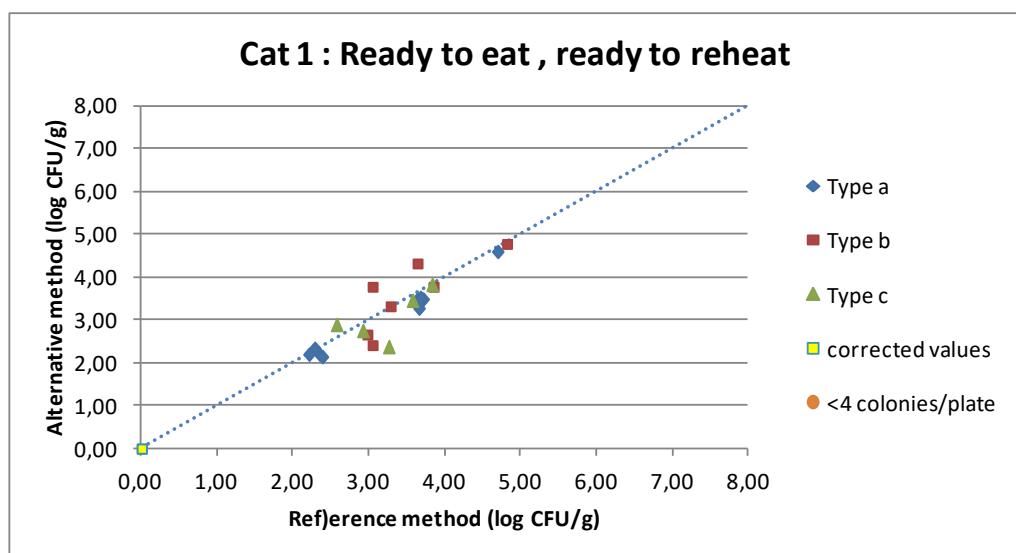

### 3.1.1.4 Statistical interpretation

The calculations are provided in **Appendix 5**.

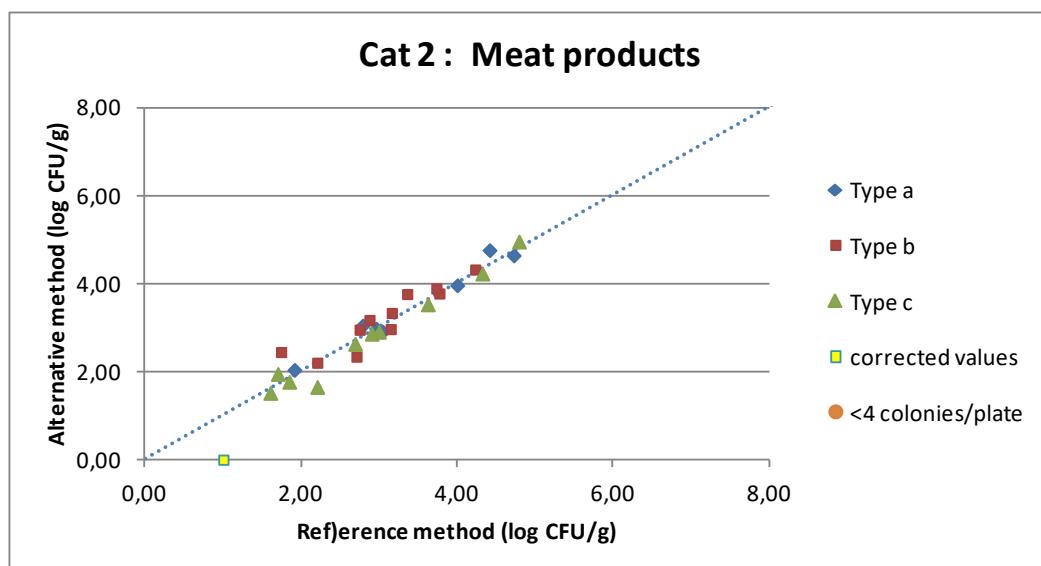

The obtained data were analysed using the scatter plot. The graphs are provided with the line of identity ( $y = x$ ):

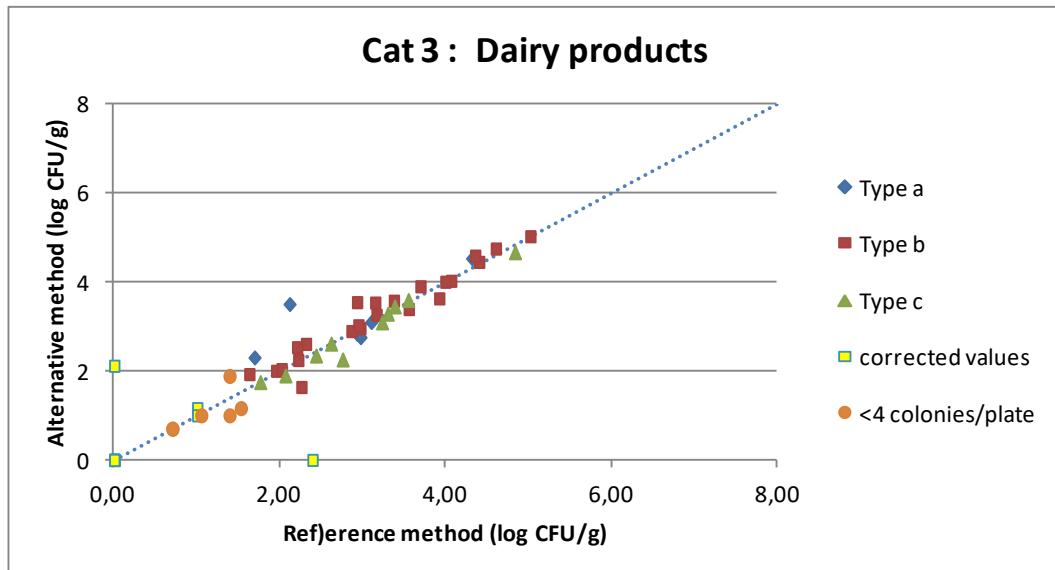

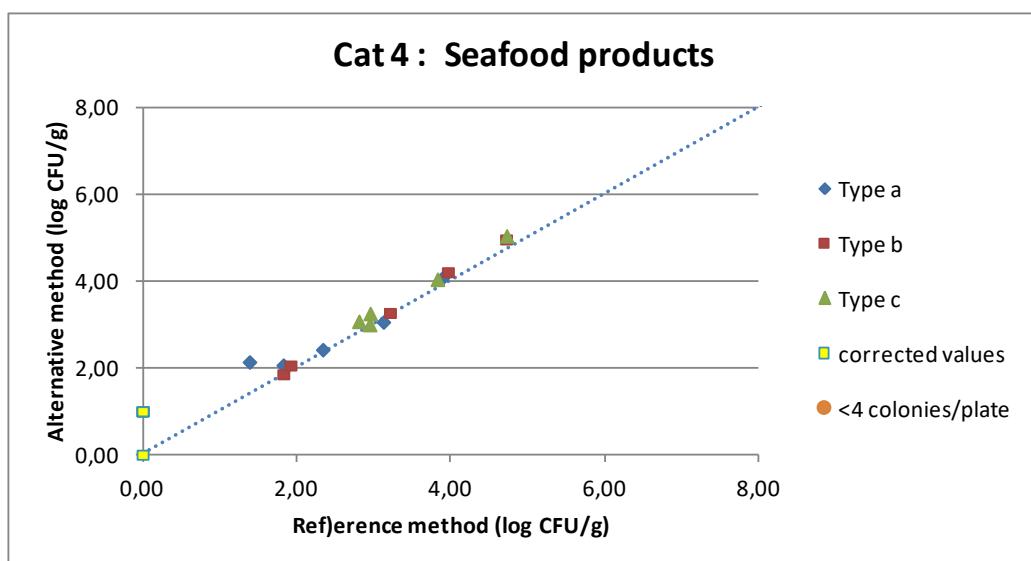

The Figures 3 to 8 show the data plotted for each individual category. The Figure 9 shows the data plotted for all the products.

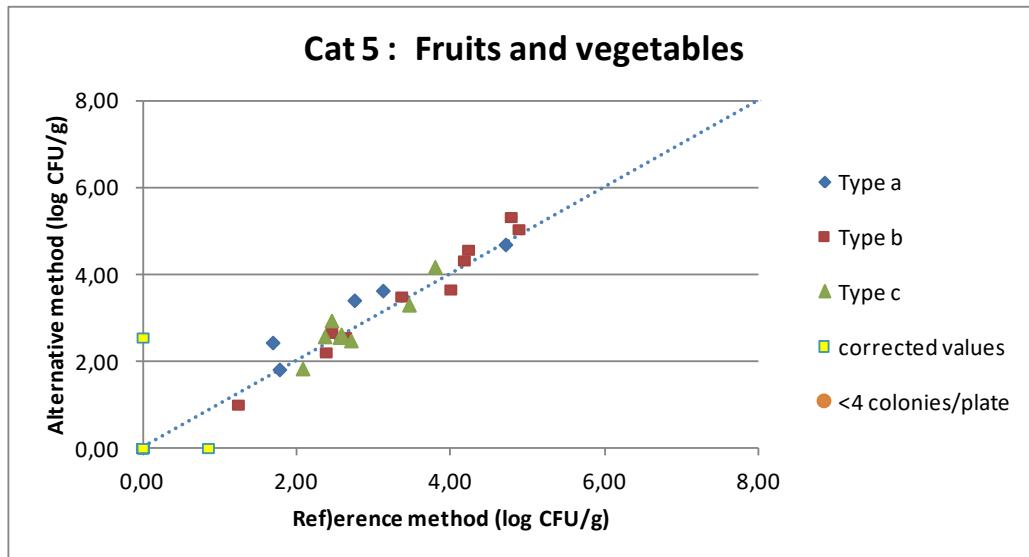

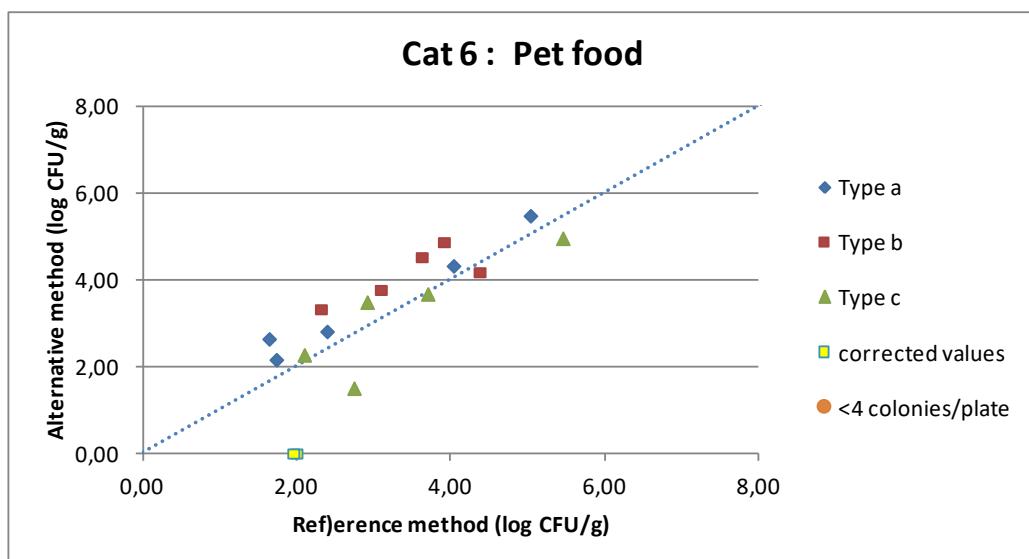

**Figure 1 - Data plotted for Ready to eat and ready to reheat products**

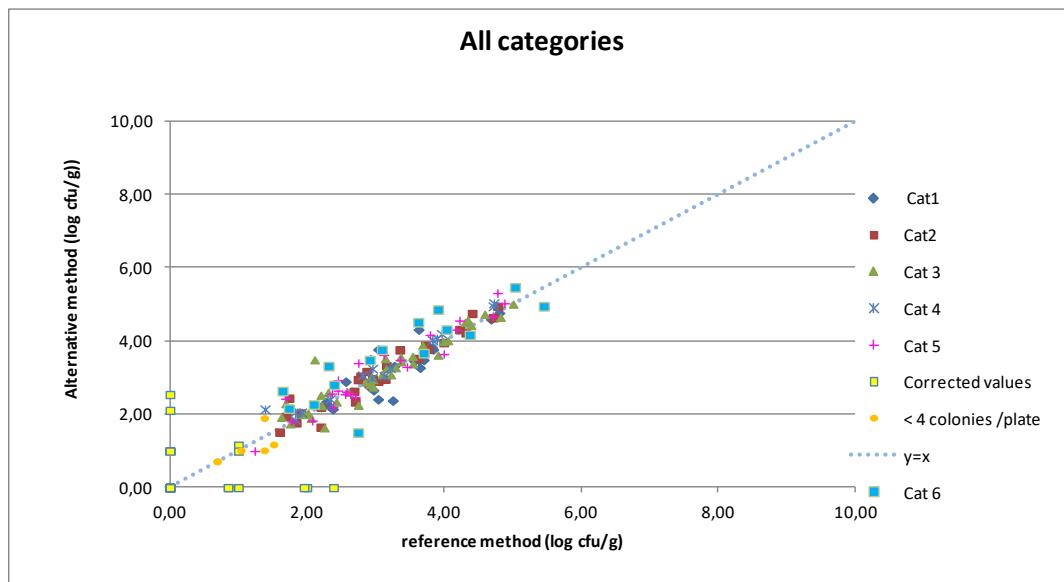

**Figure 2- Data plotted for Meat products**

**Figure 3- Data plotted for Dairy products****Figure 4- Data plotted for Seafood products**

**Figure 5- Data plotted for Fruits and vegetables****Figure 6- Data plotted for Pet food**

**Figure 7 - Data plotted for all the products**

The calculated values for Average difference and Standard deviation differences per category are provided in Table 4.

**Table 4 - Calculated values per category**

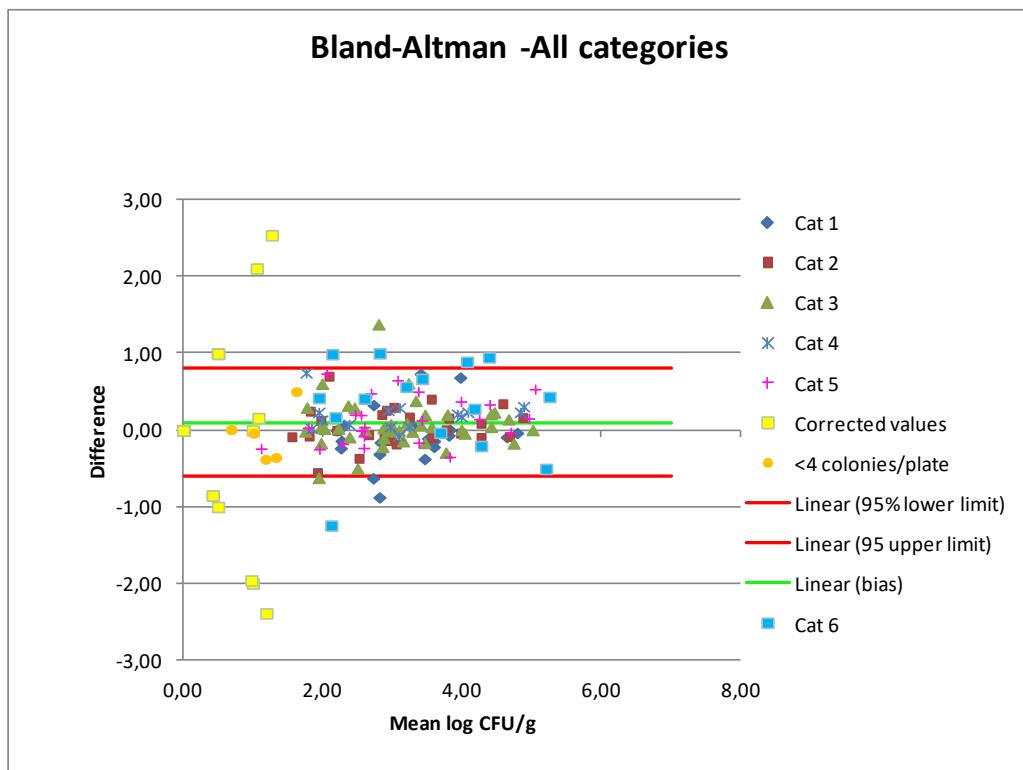

Category		n	$\bar{D}$	SD	95% lower limit	95% upper limit
1	RTE & RTRH	21	-0.08	0.36	-0,85	0,69
2	Meat products	28	0.05	0.25	-0,46	0,56
3	Dairy products	39	0.07	0.32	-0,59	0,74
4	Seafood products	15	0.20	0.19	-0,22	0,62
5	Fruits and vegetables	23	0.13	0.31	-0,52	0,79
6	Pet food	15	0.32	0.62	-1,06	1,70
All categories		141	0.09	0.36	-0,62	0,81

$\bar{D}$ : Average difference

SD: Standard deviation of differences

The bias varies from -0,08 log CFU/g to 0,32 log CFU/g. For all combined categories, the bias is 0,09 log CFU/g.

The Bland-Altman difference plot for all the samples is given Figure 10.

**Figure 8 – Bland-Altman difference plot for all the samples**

Samples for which the difference between the result observed with the reference and the alternative methods is above or lower than the limits are listed in the Table 5.

**Table 5 - Analysis of the data out of the confidence limits**

Values in green: differences in favour of the alternative method  
 Values in red: differences in favour of the reference method  
 Values in black: equivalent enumeration observed with both methods

	Corrected value
	Results calculated using enumeration lower than 4 CFU/plate

Classification of data	Category	Type	N°Sample	Product	Reference method		Alternative method		Mean	Difference
					Corrected values	True values	Corrected values	True values		
Interpretable data	1	c	2369	Cooked ham	/	3.26	/	2.38	2.82	-0.88

	5	a	282	Cabbage	/	0.85	0.00	<1.00	0.42	-0.85
	6	b	7205	Sausage for dog	/	2.00	0.00	<1.00	1.00	-2.00
	6	c	7206	Pellets for cats	/	1.96	0.00	<1.00	0.98	-1.96
	3	a	241	Ice cream (red fruits)	0.00	<1.00	/	2.11	1.06	2.11
	4	a	201	Raw shells	0.00	<1.01	1.00	<2.00	0.50	1.00
	4	a	221	Raw oysters	0.00	<1.00	1.00	<2.00	0.50	1.00
	4	a	223	Trout	0.00	<1.00	1.00	<2.00	0.50	1.00
	4	a	256	Raw sea almonds	0.00	<1.00	1.00	<2.00	0.50	1.00
	4	a	257	Clams	0.00	<1.00	1.00	<2.00	0.50	1.00
	5	b	293	Dried apples	0.00	<1.00	/	2.55	1.27	2.55

### 3.1.1.5 Discordant results

20 samples are outside of the 95 % confidence limits. Their repartition is given in Table 6.

**Table 6 - Repartition of the samples outside of the 95 % Confidence Limits**

		Number of samples
Interpretable results by both methods	< LCL	2
	> UCL	5
	Total	7
< or > the quantification limit	< LCL	6
	> UCL	7
	Total	13
<b>Total &lt; LCL</b>		<b>8</b>
<b>Total &gt;UCL</b>		<b>12</b>
<b>Total</b>		<b>20</b>

For a majority of samples (13), the differences observed between the reference and the alternative methods are explained by the fact that one of the two results is below the detection limit.

In the other cases (7 samples concerned), the difference was in favour of the alternative method (5 times) and in favour of the reference method (2 times). The differences varied from - 1.24 to 1.38 log.

### 3.1.1.6 Conclusion

The relative trueness of the alternative method is satisfying.

### 3.1.2 Accuracy profile

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and  $\beta$ -expectation tolerance intervals, both reported to different levels of the reference value.

#### 3.1.2.1 Experimental design

Six matrix/strain pairs were tested. A minimum of one type per category, and therefore 2 different batches, were selected, using 6 samples per type. 2 samples were contaminated at a low level, 2 at intermediate level, 2 at a high level. For each sample, 5 replicates (5 different test portions) were tested. In the end, 30 samples were tested per matrix type.

The following matrix/strain pairs were studied (See Table 7).

**Table 7 - Matrix/strain pairs**

Category		Matrix	Inoculated strain	Origin	Inoculation level CFU/g
1	<b>Ready to eat and ready to reheat</b>	Pâté	<i>E. coli</i> 144	Ready to reheat meal	100 5 000 100 000
2	<b>Meat products</b>	Ground beef	<i>E. coli</i> 13	Ground beef	
3	<b>Dairy products</b>	Pasteurized milk	<i>E. coli</i> 94	Cheese	
4	<b>Fruits and vegetables</b>	Grated carrots	<i>E. coli</i> 19	Grated carrots	
5	<b>Seafood</b>	Raw fish fillet	<i>E. coli</i> Ad228	Fish	
6	<b>Pet food</b>	Dog pâté	<i>E. coli</i> 123	Veal liver	

#### 3.1.2.2 Calculation and interpretation

The raw data are provided in **Appendix 6** and the summary tables (in log CFU/g) in **Appendix 7**. The statistical results and the accuracy profiles are provided in Figure 11.

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 2027-01-2015 available on <http://standards.iso.org/iso/16140>

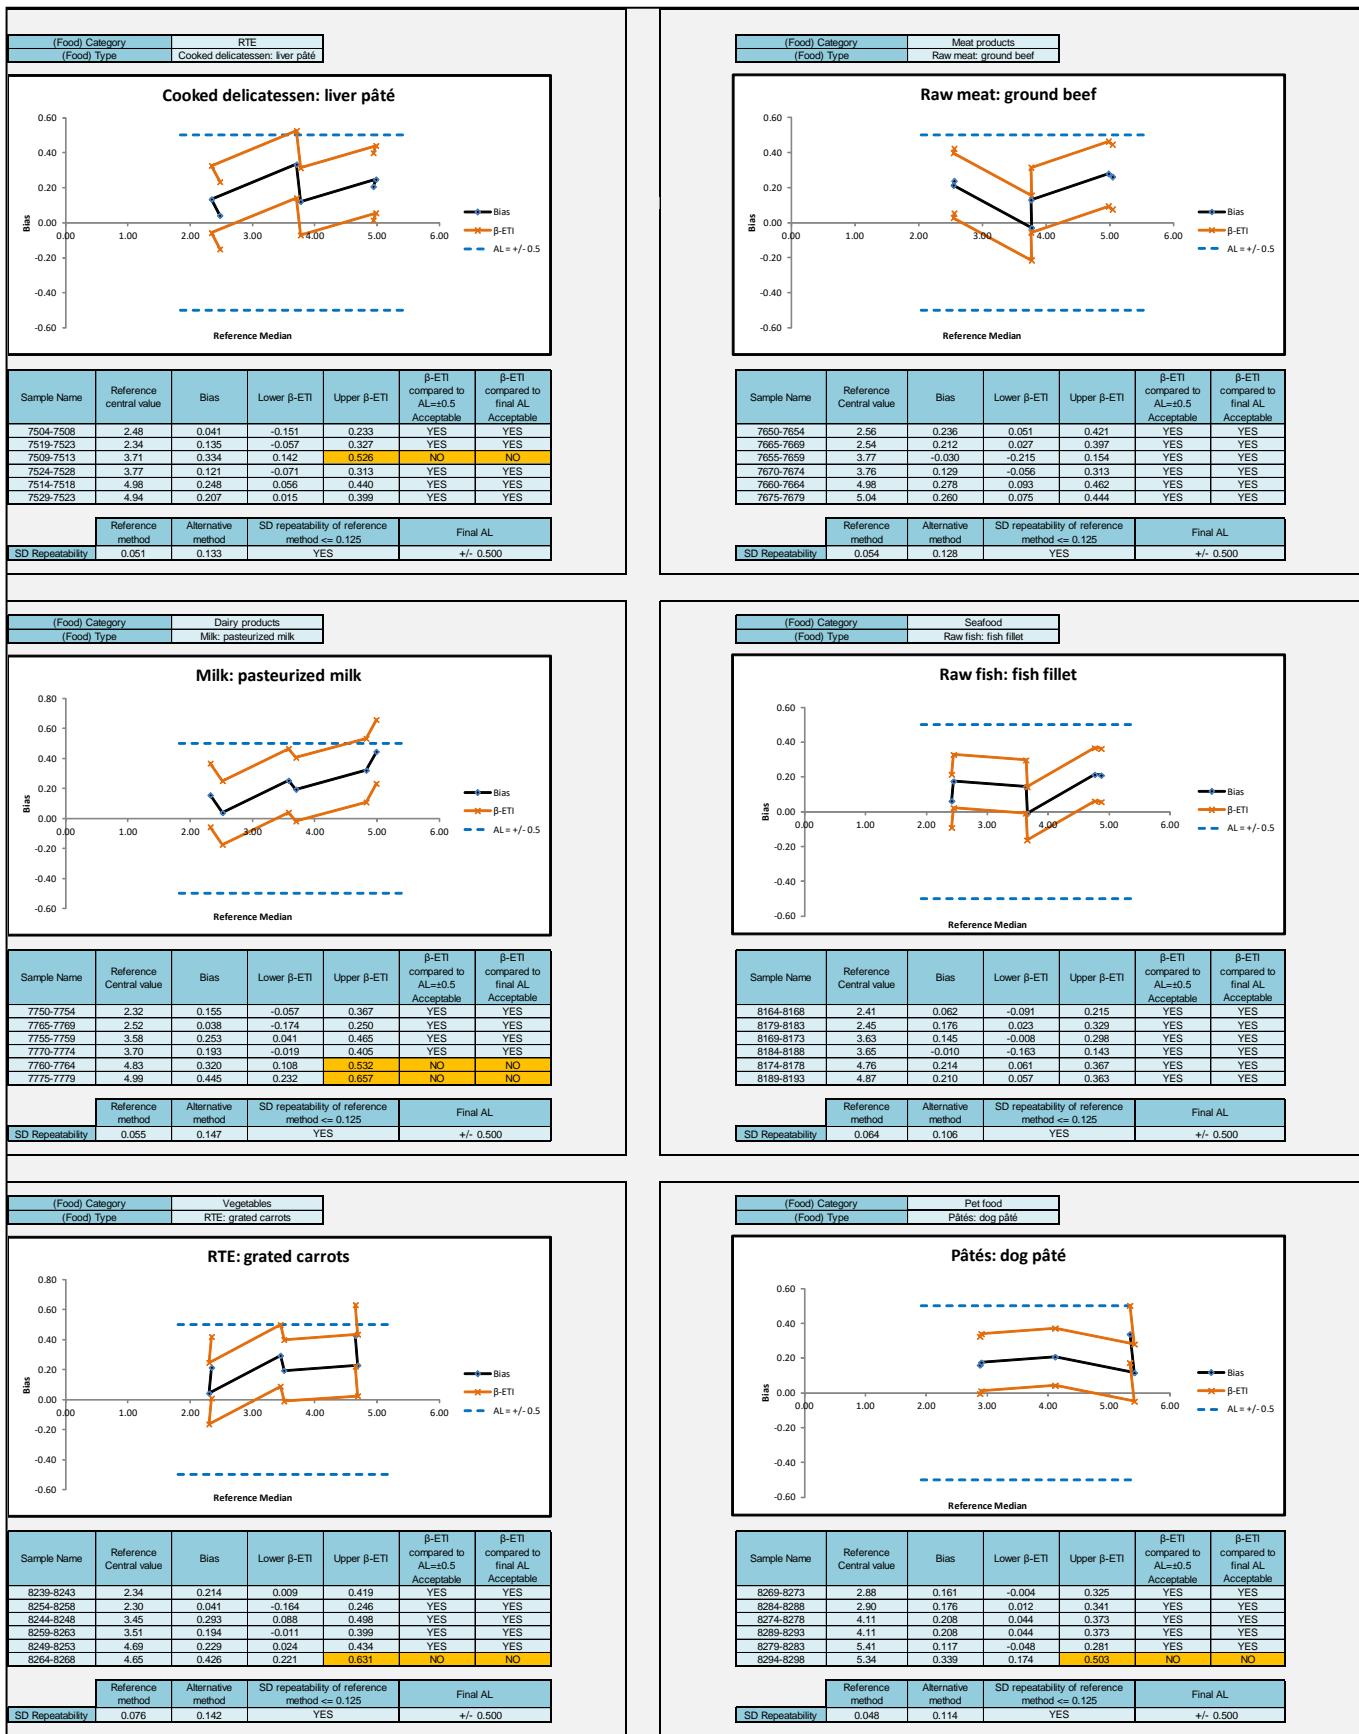

The following interpretations were done:

- Level 1: 1/40                  Level 2: 1/400 when available                  Level 3: 1/400
- Level 1: 1/40                  Level 2: 1/4000                  Level 3: 1/4000

## Figure 9 – Accuracy profile Dilution 1/40 / 1/400

# Accuracy profile Dilution 1/40 / 1/4000

When the 1/40 and 1/400 dilutions are used for interpretation, the upper limit is above the acceptability limit for the high inoculation level for all the tested matrices. For four matrices this concerns only one matrix batch among the two tested. For the lower and the medium inoculation levels, the limits are within the acceptability limits for the six matrix strain pairs tested.

Contamination levels observed on naturally contaminated samples are generally very low. The criteria for *E. coli* are comprised between 1 CFU to < 500 CFU/g (FCD, Commission Regulation N°2013/2015 on microbial criteria for foodstuffs). According the AFNOR Technical Rules (Version 5) inoculation levels between 300 and  $10^5$  CFU were tested. This resulted for using the 1/400 or 1/4000 dilutions.

When 1/40 and 1/4000 dilutions are used, the upper limit is above the acceptability limit for:

- Liver pâté, Level 2 (Upper  $\beta$  ETI = 0.526);
- Pasteurized milk, Level 3 (Upper  $\beta$  ETI = 0.532 and 0.657).

A positive bias due to a better recovery of *E. coli* with TEMPO EC method compared to ISO 16649-2 was previously observed and demonstrated.

If the average bias is subtracted from the values obtained for  $\beta$  ETI for these two matrices, the upper limits ( $D = 0.1 \log$ ) are within the acceptability limits for all the tested matrices.

For the renewal study run in 2012, additional testing run on a whipped cream from pastry was tested. Using the two reference methods (ISO 16140 Part 1 (membrane enumeration) and Part 2 (pour plate enumeration) and the TEMPO® EC method, the following results were obtained:

Product	ISO 16649-1	ISO 16649-2	TEMPO EC
Whipped cream from "Baba au rhum"	3.69	2.92	3.38

The ISO 16649-1 is recommended for analysis of samples supposed to contain injured bacteria. The enumeration observed with TEMPO® EC is close to the enumeration obtained with the ISO 16649-1 indicating that the TEMPO® EC method has better performances than the ISO 16649-2 for enumeration of injured bacteria. This could explain the bias observed for the accuracy profiles.

An article from Baylis, Green, Betts (2006) confirms this hypothesis: 57 samples (fresh or frozen) were tested using the ISO 16649-1, ISO 16649-2 and the TEMPO® EC method. The ISO 16649-1 showed a better recovery of the injured cells, the enumeration obtained with the TEMPO® method were similar to those of the ISO

16649-1 standard and the lowest enumerations were obtained using the ISO 16649-2 standard.

### 3.1.2.3 Conclusion

**Considering the positive bias of TEMPO EC method, the accuracy profiles are comprised within the acceptability limits when the 1/40 and 1/4000 dilutions are used, in agreement with the level of contamination of samples.**

### 3.1.3 Inclusivity and exclusivity

*The inclusivity study involves pure target strains to be detected or enumerated by the alternative method. The exclusivity study involves pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.*

#### 3.1.3.1 Protocols

During the initial validation, 30 target strains and 20 non target strains were tested *in duplicita* with the compared methods. The pure cultures were as well enumerated on non-selective agar, i.e. PCA.

20 additional target strains and 10 non-target strains were tested for the renewal study.

#### 3.1.3.2 Results

The raw data are given in **Appendix 8**.

The *E. coli* strains which shown characteristic colonies on TBX ( $\beta$ -glucuronidase positive) were detected by the TEMPO® EC method.

For most of the tested target strains, the enumeration results are a little bit higher with the TEMPO® EC method in comparison to the ISO 16649-2.

No cross reaction was observed with the non-target strains for both methods, i.e. TEMPO® EC and ISO 16649-2.

**TEMPO EC method shows satisfying specificity and selectivity.**

### 3.1.4 Limit of quantification (LOQ)

*The limit of Quantification (LOQ) is the lowest analyte concentration that can be quantified with an acceptable level of precision and trueness under the conditions of the test.*

The LOQ was determined as is it needed for the instrumental methods which are related to the growth of the microorganism.

#### 3.1.4.1 Experimental design

Blank samples were tested for each category. These blank samples were used to verify the limit of quantification of the alternative method. 10 test portions from the same sample were analysed. The same food type matrices than those tested in the accuracy profile were used.

#### 3.1.4.2 Calculation and interpretation

The threshold standard deviation  $S_0$  was calculated as followed:

$$s_0 = \frac{1}{n-1} \sum_{j=1}^n (y_j - \bar{y})^2$$

where:

$n$  = the total number of test portions used

$y_j$  = the log transformed result of test portion  $j$

$\bar{y}$  = the average log transformed result of all test portions

The limit of quantification is calculated as  $LOQ = 10 s_0$ .

#### 3.1.4.3 Results

Raw data and calculation are provided in **Appendix 9**. The results are summarized in Table 8.

**Table 8 - Quantification limits per tested matrix**

Matrix	S <sub>0</sub>	LOQ
Liver pâté	0	0
Pâté for dog	0	0
Grated carrots	0	0
Pasteurized milk	0	0
Fish fillet	0	0
Ground beef	0	0

### 3.1.5 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

<b>Storage conditions, shelf-life and modalities of utilisation after first use</b>	The storage temperatures are between 2 and 25°C (room temperature before analysis) depending on the materials and the reagents.		
<b>Time to result</b>	Steps	Reference method	Alternative method
	<b>Negative or positive samples</b>		
	Sampling	Day 0	Day 0
	Reading	Day 1	Day1
<b>Common step with the reference method</b>	Initial suspension		

The results are available in one day by both reference and alternative methods.

### 3.1.6 Conclusion

**For the initial and extension studies concerning all food products and pet food categories with incubation of the TEMPO cards at 37°C:**

- 190 samples were tested in the relative trueness study providing 141 interpretable results by both the reference and the TEMPO EC methods, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2.
- The observed profiles are comprised within the AL actually set at 0.5 Log CFU/g in the EN ISO 16140-2:2016 for the 6 matrix/strain pairs in the range of contamination usually observed for *Escherichia coli* enumerations.
- The inclusivity and exclusivity testing shows satisfying results.

### 3.2 Extension study (2023) with a new protocol for dairy products with incubation of the cards at 44°C

The flow diagram of the alternative method used for the extension study performed in 2023 is given in **Appendix 1**.

#### 3.2.1 Relative trueness study

*The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.*

##### 3.2.1.1 Number and nature of the samples

Only the dairy products category was concerned by the extension study. The repartition per tested type is provided in **Table 9**.

**Table 9 – Number and nature of the samples**

Category	Type	Items	Number of analysed	Number of samples with interpretable results	
				Cards incubated 24 h at 44°C + 24 h at 44°C ± 1°C	24 h at 44°C + 48 h at 5°C ± 3°C
Dairy products	a	Raw milk dairy products	12	9	9
	b	Dehydrated milk products	15	7	7
	c	Other dairy products	6	6	6
<b>Total</b>			<b>33</b>	<b>22</b>	<b>22</b>

33 samples were analysed, leading to 22 exploitable results.

##### 3.2.1.2 Artificial and natural contamination of the samples

Artificial contaminations were realized by spiking or seeding protocols. The inoculated strains, the contamination protocols, the injured protocols of the inoculated vegetative cells and the injury evaluation are provided in **Appendix 10**. Injury efficiency was evaluated by enumerating the pure culture on selective and non-selective agars.

33 samples were analysed; 21 were artificially contaminated by seeding protocol, 9 by spiking protocol and 3 were naturally contaminated.

Among the 22 interpretable results, all were artificially contaminated.

### 3.2.1.3 Raw data

The raw data are provided in **Appendix 11**.

The samples were analyzed by the reference and the alternative methods in order to have 15 interpretable results, and 5 interpretable results per tested type.

The data are classified in three categories (See **Table 10**):

- Interpretable results with the reference and the alternative methods.
- Results with less than 4 colonies per plate with the reference method (indicated with “\*” in the data) in order to have a more precise result. These results are not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1  $\log_{10}$  units less than the observed value in case of a lower than value. Similarly, any value greater than the upper limit should be amended by adding 1  $\log$  unit. These results are not included in the calculations but also appear on the graphs.

**Table 10 - Classification of the data**

Category	Type	Number of tested samples	Number of samples with interpretable results by both methods	Number of samples with less than 4 colonies/plate	Number of samples below or above the quantification limit
Dairy products	a Raw milk dairy products	12	9	0	3
	b Dehydrated milk products	15	7	1	7
	c Other dairy products	6	6	0	0
	Total	33	22	1	10

The samples, which were not used in the calculations for incubation 24h at 44°C and after storage of the cards for 48h at 5°C ± 3°C, are provided in **Table 11**.

**Table 11 - Samples which were not used in the calculations**

Sample N°	Product	Reference method (log CFU/g)	Alternative method (log CFU/g)	Category	Type
1007	Raw ewe milk	<1.00	0	1	a
1008	Raw goat milk	<1.00	0	1	a
1009	Raw ewe milk cheese	<1.00	<1.00	1	a
833	<b>Milk powder</b>	<1.00	<1.00	1	b
834	<b>Milk powder</b>	<1.00	<1.00	1	b
835	<b>Infant formula without probiotics</b>	<1.00	<1.00	1	b
836	<b>Infant formula without probiotics</b>	<2.00	1.00	1	b
838	<b>Infant formula with probiotics</b>	1.43*	1.00	1	b
1026	<b>Infant formula with probiotics</b>	<1.00	<1.00	1	b
1027	<b>Infant formula without probiotics</b>	<1.00	<1.00	1	b
1131	<b>Infant formula with probiotics</b>	2,62	<1.00	1	b

\*: Results with less than 4 colonies per plate with the reference method

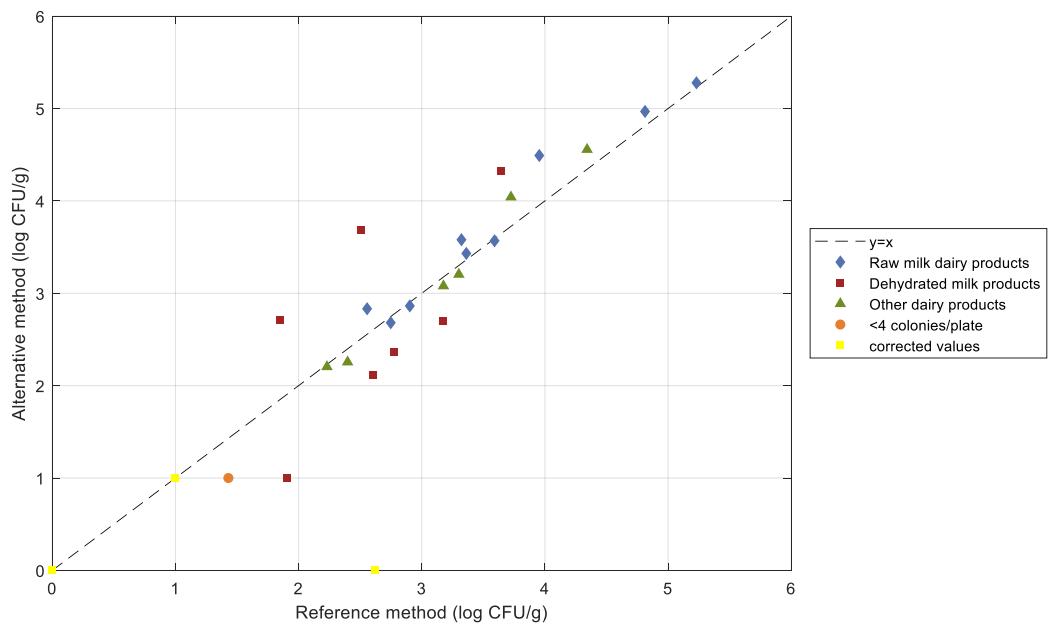

### 3.2.1.4 Statistical interpretation

The obtained data were analyzed using the scatter plot. The graphs are provided with the line of identity ( $y = x$ ).

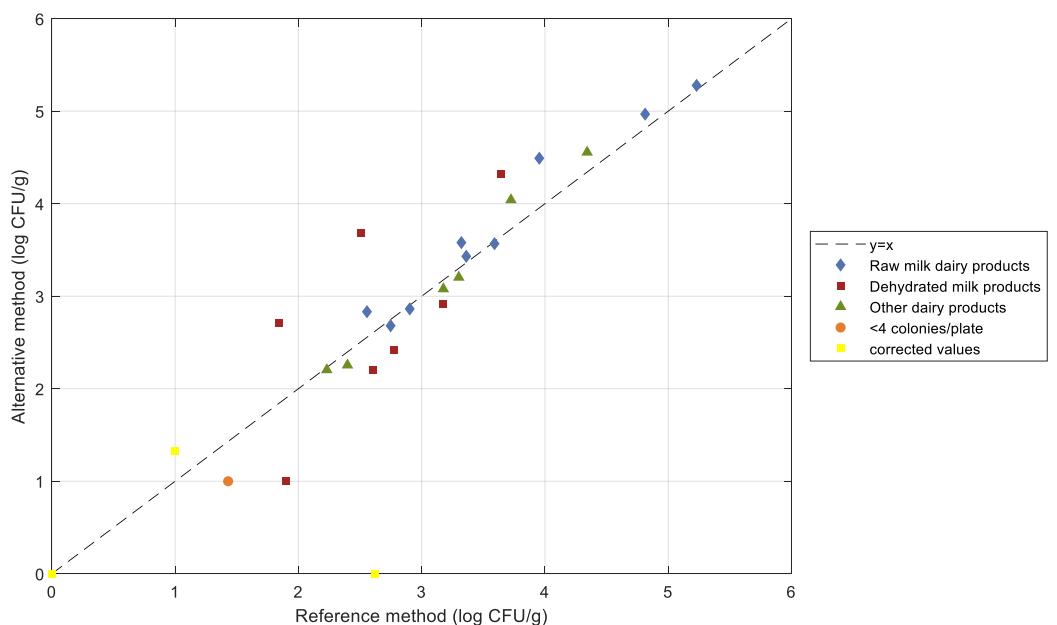

The **Figure 10** and **Figure 11** show the data plotted for the Dairy products category.

The **Figure 12** shows the data plotted for all categories combined (*excluding dairy products*) tested at 37°C (24 h incubation time) with the dairy products category tested at 44°C.

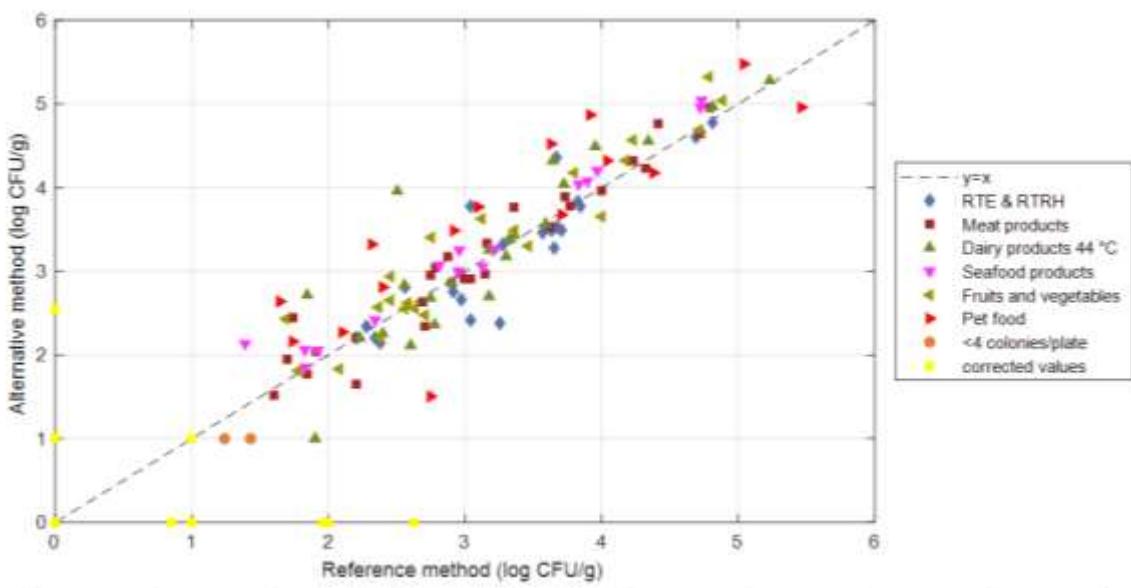

**Figure 10 - Data plotted for the Dairy products category**  
**24 h at 44°C ± 1°C**

**Figure 11 - Data plotted for the Dairy products category**  
**24 h at 44°C ± 1°C + 48h at 5°C ± 3°C**

**Figure 12 - Data plotted for all categories (24 h at 37°C $\pm$  1°C) and dairy products category (44°C 24 h at 44°C  $\pm$  1°C)**

The calculated values for Average difference and Standard deviation differences per category are provided in **Table 12**.

**Table 12 - Calculated values**

Category	Incubation time and temperature	n	$\bar{D}$ (Linear bias)	SD	95% lower limit	95% upper limit
Dairy products	24 h at 44°C $\pm$ 1°C	22	0.08	0.47	-0.90	1.07
	24 h at 44°C + 48 h at 5°C $\pm$ 3°C	22	0.10	0.45	-0.85	1.05
All categories	24 h at 37°C $\pm$ 1°C (all categories except dairy), 24 h at 44°C $\pm$ 1°C (dairy)	123	0.10	0.39	-0.68	0.89

$\bar{D}$ : Average difference (linear bias)      SD: Standard deviation of differences

The bias observed after incubation and after storage of the TEMPO cards, is closed to 0 for the dairy category tested at 44°C.

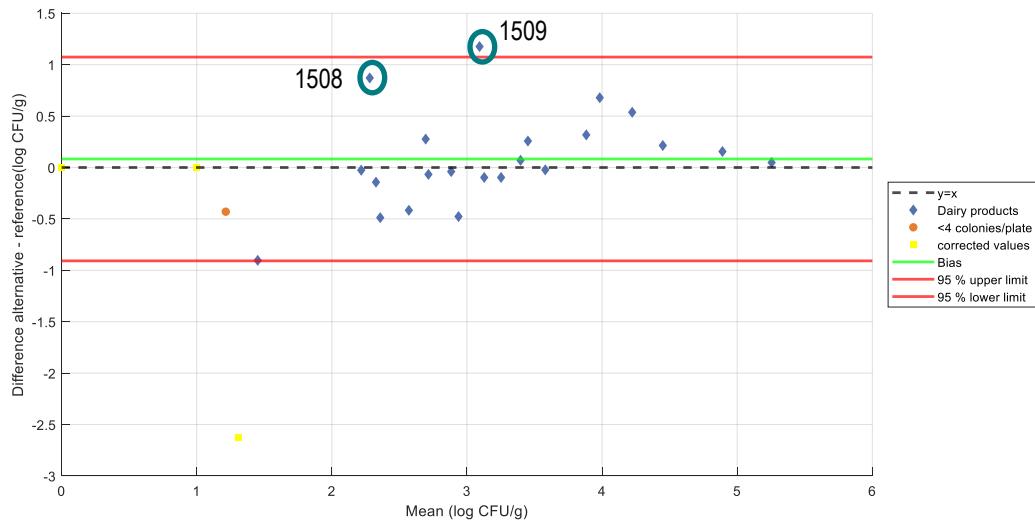

The bias for all categories when the data observed at 37°C for dairy products are replaced by the data obtained at 44°C is 0.10 log CFU/g.

Note that the bias observed for the dairy products category and for all categories combined when the cards were incubated at 37°C were respectively 0.07 and 0.09 log CFU/g.

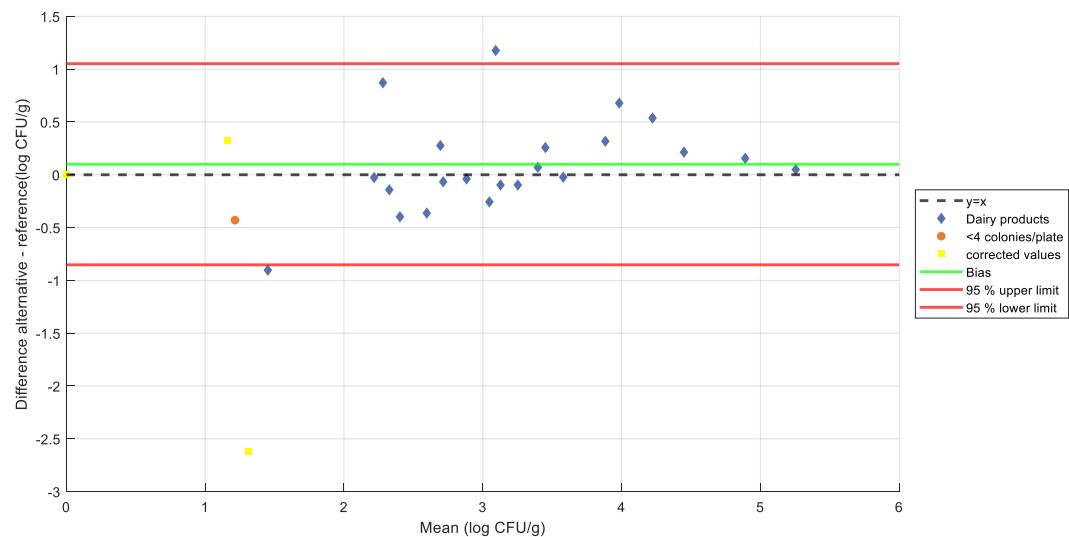

The Bland-Altman difference plot for the dairy category tested at 44°C are given **Figure 13** (after incubation time) and **Figure 14** (after cards storage).

The Bland-Altman difference plot for all categories with an incubation temperature at 37°C, except for dairy category tested at 44°C is given **Figure 15** (after incubation time).

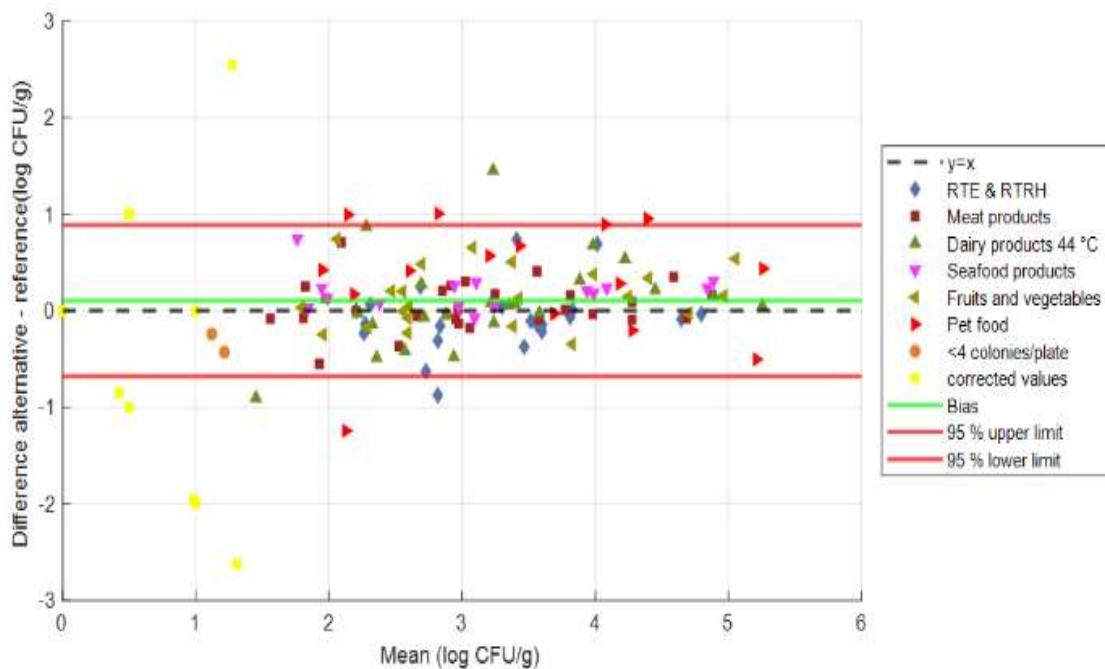

**Figure 13 – Bland-Altman difference plot for dairy products**  
**24 h at 44°C ± 1°C**

**Figure 14 – Bland-Altman difference plot for dairy products**  
**24 h at 44°C ± 1°C + 48h at 5°C ± 3°C**

**Figure 15 – Bland-Altman difference plot for all categories tested at  $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$  except dairy products category tested at  $44^{\circ}\text{C} \pm 1^{\circ}\text{C}$**

Samples for which the difference between the result observed with the reference and the alternative methods is above or lower than the limits for the dairy category tested at  $44^{\circ}\text{C}$  are listed in **Table 13**.

**Table 13 - Analysis of the data out of the confidence limits**

Values in green: differences in favour of the alternative method

Values in red: differences in favour of the reference method

Values in black: equivalent enumeration observed with both methods

	Corrected value
	Results calculated using enumeration lower than 4 CFU/plate
UCL	Upper confidence limit
LCL	Lower confidence limit

Incubation time and temperature	Classification of data	Category	Type	Sample No	Product	Reference method	Alternative method	Values before correction (Reference or/and alternative method)	Mean	Difference	Lower / Upper Limits (CLs)
24 h at 44°C ± 1°C	Interpretable data	1	b	1509	Infant formula without probiotics	2,50	3,68	/	3,09	1,18	-0,91/1,07
	< or > quantification limit	1	b	1131	Infant formula with probiotics	2,62	0,00	1,00	1,31	-2,62	
24 h at 44°C ± 1°C + 48 h at 5°± 3°C	Interpretable data	1	b	1509	Infant formula without probiotics	2,50	3,68	/	3,09	1,18	-0,85/1,05
		1	b	1025	Milk powder	1,90	1,00	/	1,45	-0,90	
	< or > quantification limit	1	b	1131	Infant formula with probiotics	2,62	0,00	1,00	1,31	-2,62	

### 3.2.1.5 Discordant results

The number of samples outside the LCs are classified in three categories (See **Table 14**).

**Table 14 - Classification of the samples outside of the CLs**

		Number of samples	
		24 h at 44°C ± 1°C	24 h at 44°C ± 1°C + 48 h at 5°± 3°C
Interpretable results by both methods	< LCL	0	1
	> UCL	1	1
	Total	1	2
<4 CFU/plate	< LCL	0	0
	> UCL	0	0
	Total	0	0
< or > the quantification limit	< LCL	1	1
	> UCL	0	0
	Total	0	1
Total < LCL		1	2
Total >UCL		1	1
<b>TOTAL</b>		<b>2</b>	<b>3</b>

For samples 1508 (milk powder) and 1509 (infant formula with probiotics), the enumeration was clearly in favour of the TEMPO EC method, respectively 1.45 and 0.87 log difference after 24 h incubation. The enumeration observed for the TEMPO EC method fits better with the inoculation level of the *E. coli* strain in the matrix.

The target inoculation levels as well as the enumeration of *E. coli* using the ISO 16649-2 and the TEMPO EC method for these two samples are given in **Table 15**.

**Table 15 – Samples showing significant higher *E. coli* enumeration with the TEMPO EC method**

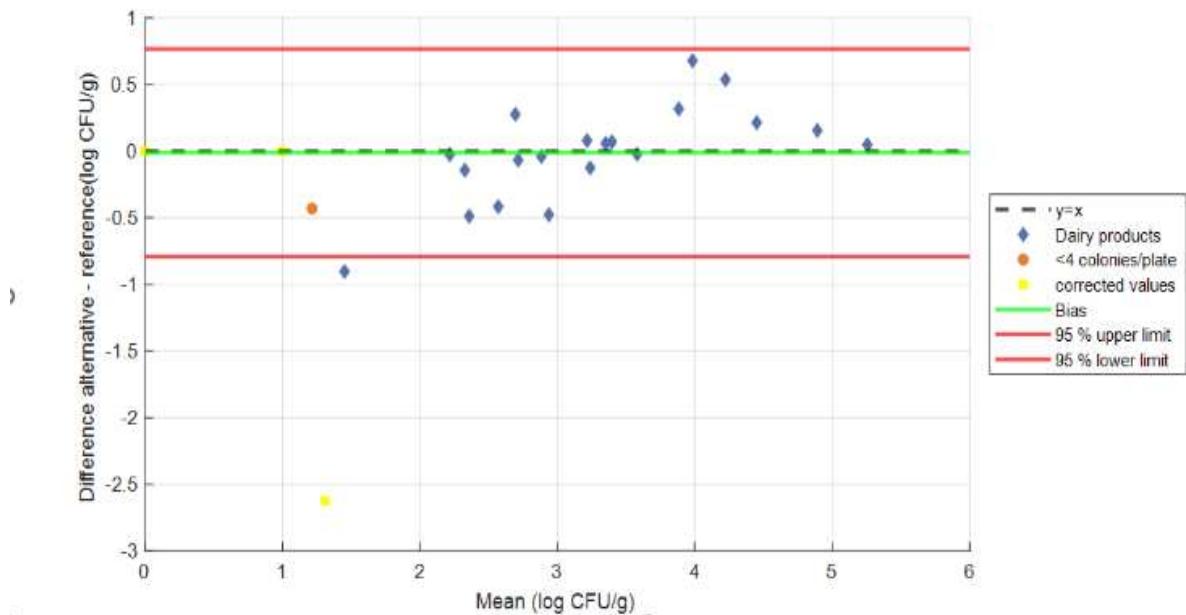

Sample N°	Product	Target inoculation level CFU/g	ISO 16649-2* CFU/g	TEMPO EC CFU/g
1508	Milk powder	1000	70	520
1509	Infant formula with probiotics	5000	520	9100

These discrepancy between the ISO 16649-2 and the TEMPO EC enumerations could be explained by the high selectivity of the TBX medium used in the ISO 16649-2 method.

\* Analyses performed according to the COFRAC accreditation

The interpretation excluding these samples from the interpretation for the dairy category tested at 44°C is given **Figure 7**. In this case, the CLS were reduced to  $\pm 0.77 \log$ .

**Figure 16 – Bland-Altman difference plot for dairy products  
24 h at 44°C  $\pm 1^\circ\text{C}$  without samples 1508 and 1509**

### 3.2.1.6 Conclusion

The relative trueness study of the alternative method is satisfying.  
The alternative method is reliable when compared to the reference method after incubation of the TEMPO cards for 24 h at 44°C  $\pm 1^\circ\text{C}$  and after storage of the cards for 48h at 5°C  $\pm 3^\circ\text{C}$

### 3.2.2 Accuracy profile study

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and  $\beta$ -expectation tolerance intervals, both reported to different levels of the reference value.

#### 3.2.2.1 Matrices

One matrix was tested with three contamination levels and five test portions per level. The tested category, type, matrix and inoculated strain are provided in **Table 16**.

**Table 16 - Category, type and matrix**

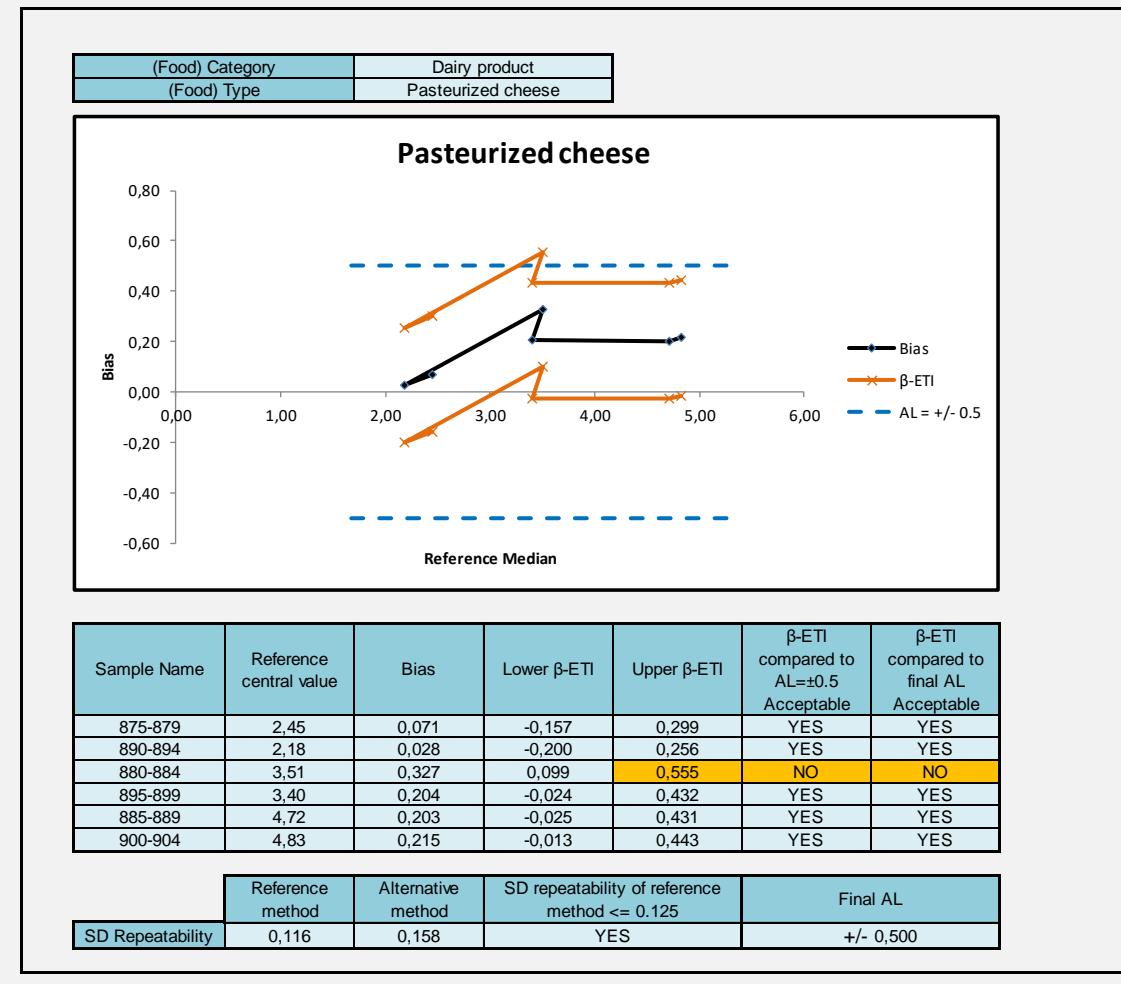

Category	Type	Matrix	Strain	Origin	Target inoculation level (CFU/g)
Dairy products	c	Pasteurized cow milk cheese	<i>E. coli</i> 94	Cheese	100 5000 100000

#### 3.2.2.2 Calculation and interpretation

The raw data are provided in **Appendix 12**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 13**. The statistical results and the accuracy profiles are provided **Figure 17**.

The same results were obtained before and after storage of the TEMPO cards for 48h at  $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$ .

The calculations will be done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 31-07-2018 available on <http://standards.iso.org/iso/16140>.

**Figure 17 – Accuracy profile**

The lower and upper  $\beta$ .ETI are within the acceptability limits for the low and high inoculation levels. For the intermediate inoculation level, the Upper  $\beta$ -ETI is above the AL fixed at  $\pm 0.5$  log for one batch (Upper  $\beta$ -ETI=0,555).

### 3.2.2.3 Conclusion

**The observed profiles meet the AL except for one batch inoculated at the intermediate level ( $\beta$ -ETI>AL).**

### 3.2.3 Inclusivity study

This part was not tested again in agreement with AFNOR Technical committee.

### 3.2.4 Conclusion

The observed data and interpretation confirm the performances of the alternative method:

- **22 samples were tested in the relative trueness study**, which satisfied the required criteria for quantitative method comparison per ISO 16140-2; **this study confirms as well the possibility to store the TEMPO cards for 48h at 5°C ± 3°C.** Some discrepancies were observed between the ISO 16649-2 method and the TEMPO EC method but in some cases, the data observed with the TEMPO EC method fits better with the target inoculation level. This could be explained by the high selectivity of the TBX medium used in the ISO 16649-2 method.
- **It is possible to store the TEMPO cards for 48h at 5°C ± 3°C before reading.**
- **The observed profiles meet the AL actually set at ± 0.5 Log CFU/g in the EN ISO 16140-2:2016 except for one batch inoculated at the intermediate level (Upper β-ETI= 0.555>AL=0.5).**

### 3.3 Inter-laboratory study

*The aim of the inter-Laboratory study is to determine the variability of the results obtained in different laboratories using identical samples and to compare these results with those obtained in the methods comparison study.*

The results of the inter-laboratory Study run in 2005 were interpreted according to the EN ISO 16140-2:2016 standard using Excel spread sheet available at <http://standards.iso.org/iso/16140> (AP Calculation tool ILS (clause 6.2.3 Calculation summary and interpretations of data) ver 14.03.2016).

#### 3.3.1 Study organisation

The used matrix was pasteurized half-skimmed milk. Twelve laboratories participated to this study

#### 3.3.2 Experimental parameters control

##### 3.3.2.1 Strain stability

In order to verify the stability of the strain in the matrix, two samples per inoculation level were enumerated the day of inoculation and after one day storage at  $3^{\circ}\text{C} \pm 2^{\circ}\text{C}$  (See Table 17).

**Table 17 - *E. coli* 94 enumeration with the reference method (CFU/ml)**

	Level 1	Level 2	Level 3
Day 0	50	710	6 700
	100	850	7 200
Day 1	68	650	8 100
	59	740	8 800

No evolution was observed.

##### 3.3.2.2 Homogeneity of inoculation

This test was not run for the inter-laboratory study as it was not required in 2005 (inter-laboratory study run according to the ISO 16140:2003).

### 3.3.3 Results analysis

The raw data are given in **Appendix 14**.

#### 3.3.3.1 Results obtained by the expert Lab.

The results obtained by the expert Lab. are the following (See Table 18).

**Table 18 – Results obtained by the expert Lab.**

Inoculation level	Reference method		Alternative method	
	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2
0	< 10	< 10	< 10	< 10
1	68	59	130	21
2	650	740	900	1 700
3	8 100	8 800	15 000	7 800

Targeted contamination levels were reached.

#### 3.3.3.2 Results obtained by the collaborators

A summary of the test results is given in Table 19 (CFU/g) and Table 20 (log CFU/g).

Lab E made an inversion between one sample from Level 0 (E5) and one sample from Level 1 (E2). This lab was not kept for data interpretation at Level 1.

**Table 19 - Summary of data (CFU/g)**

Labora-tories	Reference method		Alternative method													
	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2	Duplicate 1	Duplicate 2

### 3.3.4 Calculations and interpretation

#### 3.3.4.1 Visual linearity checking

The Figure 18 shows the data points after  $\log_{10}$  transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method. The data are distributed closely to the first bisecting line.

**Figure 18 - Visual linearity checking**

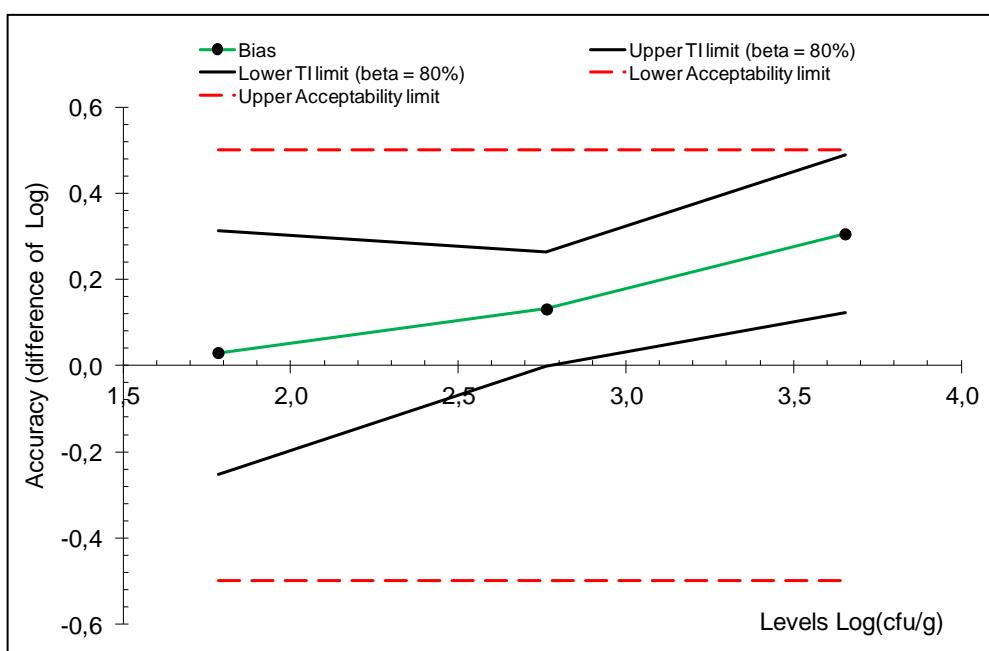

#### 3.3.4.2 Accuracy profile calculation

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140>. A summary of the statistical test is provided in Table 21.

**Table 21 - Summary of the statistical test**

Accuracy profile		TEMPO EC					
Study Name	2005						
Date	ADRIA						
Tolerance probability (beta)	80%	80%	80%				
Acceptability limit in log (lambda)	0.5	0.5	0.5				
Levels	Alternative method			Reference method			
	Low	Medium	High	Low	Medium	High	
<b>Target value</b>	<b>1.783</b>	<b>2.763</b>	<b>3.654</b>				
Number of participants (K)	11	12	12		11	12	12
Average for alternative method	1.814	2.895	3.959		1.783	2.763	3.654
Repeatability standard deviation (sr)	0.209	0.098	0.126		0.159	0.065	0.081
Between-labs standard deviation (sL)	0.000	0.000	0.051		0.000	0.000	0.160
Reproducibility standard deviation (sR)	0.209	0.098	0.136		0.159	0.076	0.180
Corrected number of dof	20.952	22.957	22.246		20.952	21.036	13.501
Coverage factor	1.353	1.347	1.352				
Interpolated Student t	1.323	1.320	1.321				
Tolerance interval standard deviation	0.2137	0.1001	0.1388				
Lower TI limit	1.531	2.763	3.776				
Upper TI limit	2.096	3.027	4.143				
<b>Bias</b>	<b>0.030</b>	<b>0.131</b>	<b>0.306</b>				
<b>Upper TI limit (beta = 80%)</b>	<b>-0.253</b>	<b>-0.001</b>	<b>0.123</b>				Pooled repro standard dev = 0.145
<b>Lower TI limit (beta = 80%)</b>	<b>0.313</b>	<b>0.263</b>	<b>0.489</b>				New acceptability limit (ALs) = 0.479
<b>Lower Acceptability limit</b>	<b>-0.50</b>	<b>-0.50</b>	<b>-0.50</b>				
<b>Upper Acceptability limit</b>	<b>0.50</b>	<b>0.50</b>	<b>0.50</b>				

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given Figure 19.

**Figure 19**

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of 0.5 log.

**The results obtained with the alternative method are not statistically different than those obtained with the reference method.**

### 3.3.5 Conclusion

The quality assurance parameters were verified (i.e. inoculation homogeneity, targeted levels, strain stability, logistic conditions, analyses), confirming that the inter-laboratory study was conducted in appropriate conditions.

The data interpretations were done according to the EN ISO 16140-2:2016. For the three contamination levels, the alternative method is accepted as equivalent to the reference method.

## 4 GENERAL CONCLUSION

---

The observed data and interpretation confirm the performances of the alternative method whatever the incubation temperature used for incubation of the TEMPO cards, 37°C for all food and pet food categories, 44°C for the dairy products category:

### Method comparison study

- For the initial and extension studies concerning all food products and pet food categories with incubation of the TEMPO cards at 37°C:
  - 190 samples were tested in the relative trueness study providing 141 interpretable results by both the reference and the TEMPO EC methods, which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2;
  - The observed profiles are comprised within the AL actually set at 0.5 Log CFU/g in the EN ISO 16140-2:2016 for the 6 matrix/strain pairs in the range of contamination usually observed for *Escherichia coli* enumerations.
  - The inclusivity and exclusivity testing shows satisfying results.

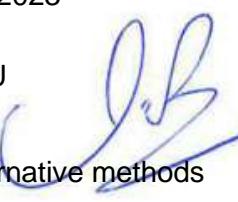

- > For the extension study concerning the dairy products category with incubation of the TEMPO cards at 44°C
  - o 22 interpretable data were obtained in the relative trueness study, which satisfied the required criteria for quantitative method comparison per ISO 16140-2; this study confirms as well the possibility to store the TEMPO cards for 48h at 5°C ± 3°C. Some discrepancies were observed between the ISO 16649-2 method and the TEMPO EC method but in some cases, the data observed with the TEMPO EC method fits better with the target inoculation level. This could be explained by the high selectivity of the TBX medium used in the ISO 16649-2 method.
  - o It is possible to store the TEMPO cards for 48h at 5°C ± 3°C before reading.
  - o The observed profiles meet the AL actually set at ± 0.5 Log CFU/g in the EN ISO 16140-2:2016 except for one batch inoculated at the intermediate level (Upper β-ETI= 0.555>AL=0.5).

#### Interlaboratory study

- > The quality assurance parameters were verified (i.e. inoculation homogeneity, targeted levels, strain stability, logistic conditions, analyses), confirming that the inter-laboratory study was conducted in appropriate conditions.
- > The data interpretations were done according to the EN ISO 16140-2:2016. For the three contamination levels, the alternative method is accepted as equivalent to the reference method.

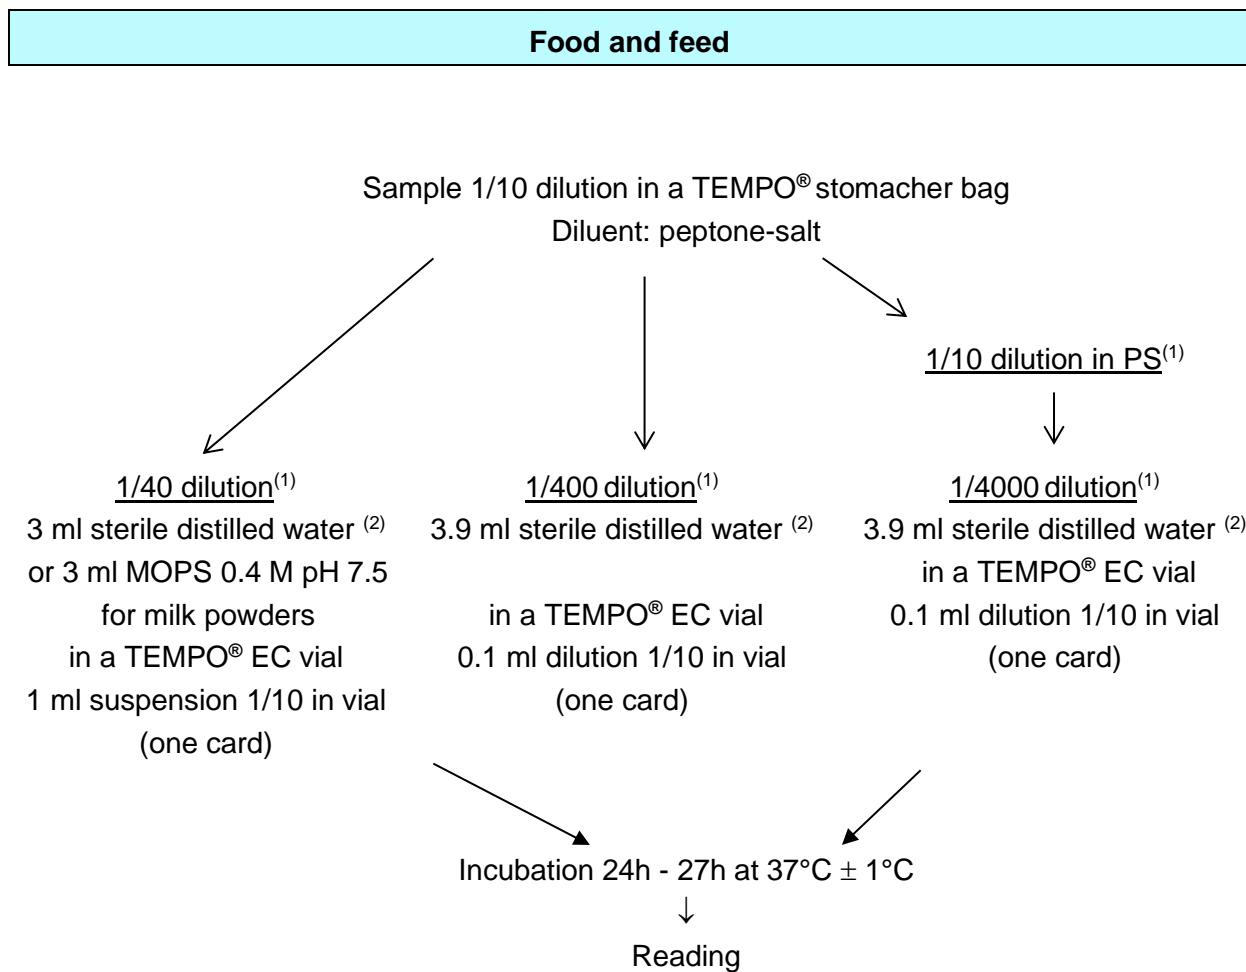

Based on the results obtained for the method comparison study and the inter-laboratory study, the TEMPO® EC method is considered equivalent to the reference method.

Quimper, 17 May 2023

Maryse RANNOU  
 Project Manager  
 Validation of Alternative methods  
  
 Food Safety & Quality

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

## Appendix 1 - Flow diagram of the alternative method: TEMPO® EC

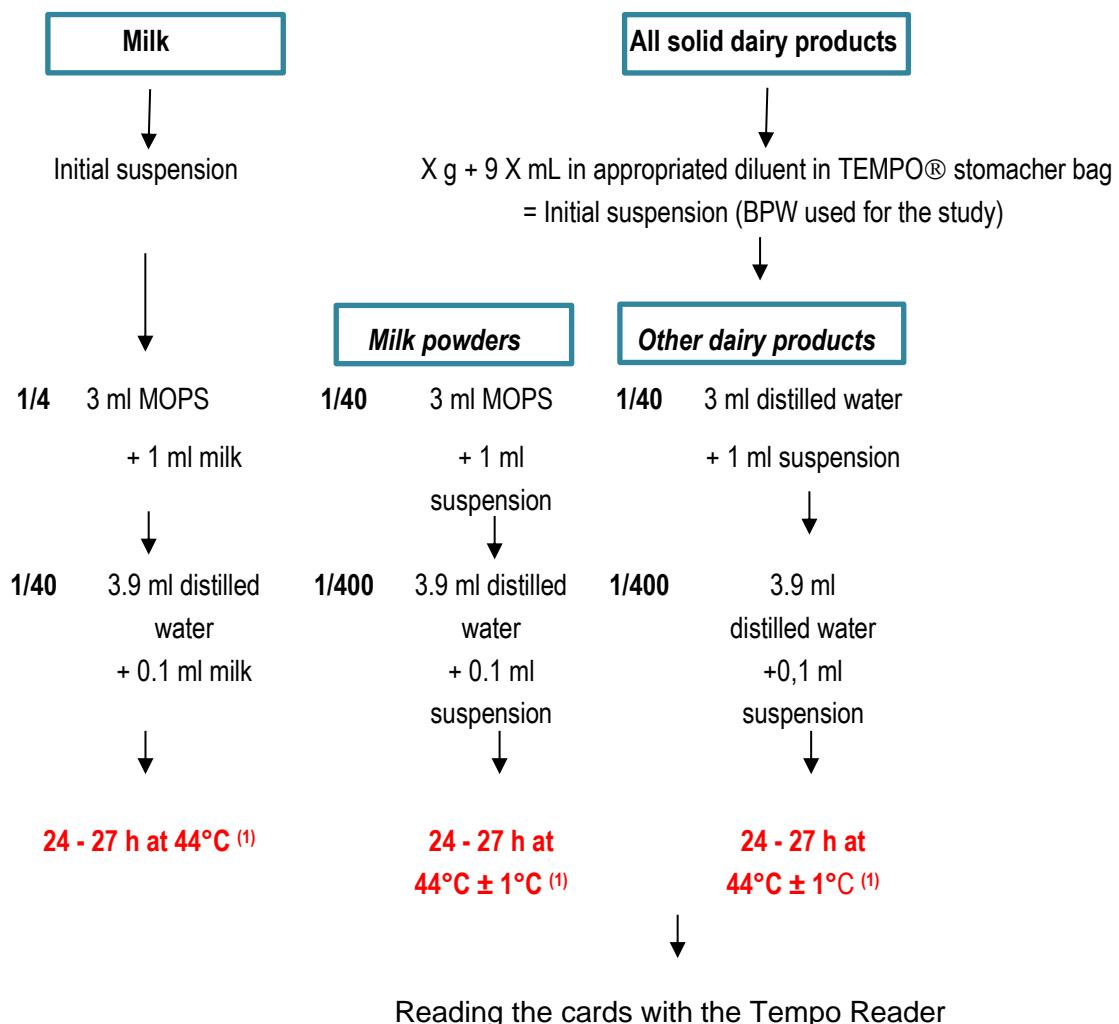

The 1/40 dilution allows 10 to 49 000 cfu/g enumeration

The 1/400 dilution allows 100 to 490 000 cfu/g enumeration

<sup>(1)</sup> Dilution in distilled water for all the products, except milk powders

<sup>(2)</sup> Dilutions mentioned here were tested during validations studies. Depending on the expected level of contamination and the nature of the product (liquid or solid), the dilution level can be adapted.

## Dairy products (Extension 2023)

Incubation 24h - 27h at 44°C ± 1°C for dairy products

Possibility to store the TEMPO cards for 48 h at 5°C ± 3°C

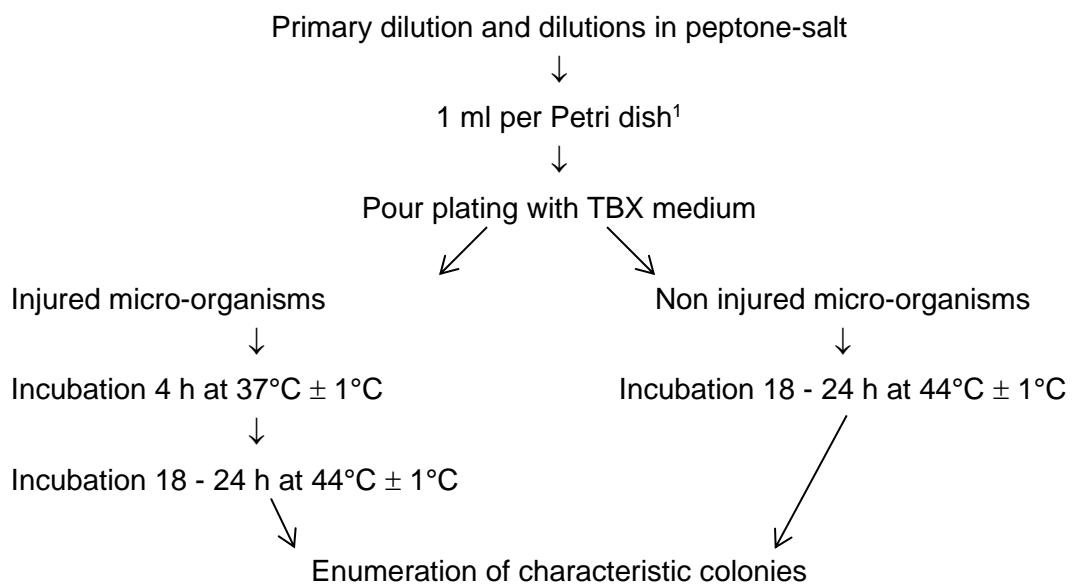

The 1/4 dilution allows 1 to 49 00 CFU/g enumeration

The 1/40 dilution allows 10 to 49 000 CFU/g enumeration

The 1/400 dilution allows 100 to 490 000 CFU/g enumeration

*Dilutions mentioned here were tested during validations studies. Depending on the expected level of contamination and the nature of the product (liquid or solid), the dilution level can be adapted.*

**Appendix 2 - Flow diagram of the reference method: the ISO 16649-2 (July 2001):  
Horizontal method for the enumeration of  $\beta$  glucuronidase positive *Escherichia coli* –  
Part 2: colony-count technique at 44°C using 5-bromo-4-chloro-3 indoly  $\beta$ -D-glucuronate**

<sup>1</sup> Note that for the Validation Study, 2 Petri dishes were used per dilution for the analyses run in 2004 and 2006
