Quality Assurance documents related to this study can be consulted upon request from **bioMérieux**.

Measurement uncertainty on the reference method results is not taken into account to provide the conclusion in this report; this measurement uncertainty is however available.

The technical protocol and the result interpretation were realised according to the EN ISO 16140-2:2016 and the AFNOR technical rules (PR Revision 7).

Validation protocols	<ul style="list-style-type: none"> ▪ ISO 16140-1 (2016): Microbiology of the food chain - Method validation — <i>Part 1: Vocabulary</i> ▪ ISO 16140-2 (2016): Microbiology of the food chain - Method validation — <i>Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method</i> ▪ AFNOR technical rules (PR Revision 7).

1 INTRODUCTION

The **CHROMID® Coli (COLI ID-F) for the enumeration of coliforms** was validated in 2006 according to the EN ISO 16140:2003 protocol and the AFNOR technical rules (Certificate number: BIO 12/20 - 12/06).

Table 1 summarizes the different steps of the validation that occurred since the initial validation.

Table 1 - Steps of the AFNOR Certification validation

Date	Study
14/12/2006	Initial Validation for a broad range of food according to ISO 16140 (2003)
2010	Renewal study
27/11/2014	Renewal study
December 2018	Renewal study according to the EN ISO 16140-2:2016.
October 2022	Renewal study

2 METHODS DESCRIPTION

2.1 Alternative method

2.1.1 Principle

The CHROMID® Coli (Coli ID) is a chromogenic medium which allows the enumeration of coliforms and *Escherichia coli*. This medium contains 2 chromogenic substrates. The coliforms (different from *Escherichia coli*) appear as blue to grey colonies. The *Escherichia coli* appear as pink to violet due to the presence of β -glucuronidase. Both aspects of colonies need to be considered for coliforms enumeration.

2.1.2 Protocol

The protocol is described in **Appendix 1**.

2.1.3 Restrictions

There is no restriction for use.

2.2 Reference method♦

The reference method is the NF ISO 4832 (2006): Microbiology of food and animal feeding stuffs - Horizontal method for the enumeration of coliforms - Colony-count technique. The flow diagram is provided in **Appendix 2**.

2.3 Protocol applied during the initial validation and the renewal study

The plates were incubated for 22 h at 37°C ± 1°C.

3 INITIAL VALIDATION, EXTENSION/RENEWAL STUDIES: RESULTS

3.1 Method comparison study

The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.

The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.

For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.

3.1.1 Relative trueness

The relative trueness is the degree of correspondence between the response obtained by the reference method and the response obtained by the alternative method on identical samples.

3.1.1.1 Number and nature of the samples

Five food categories were tested with a minimum of 15 interpretable results per category and 5 interpretable results per type.

96 samples were tested for the initial validation study, 51 for a study run for bioMérieux in 2011 and 30 samples for the last renewal study (2018).

The repartition per tested category and type is provided in **Table 2**. Combining all the studies 177 samples were tested, leading to 135 exploitable results.

Table 2 – Repartition per tested category and type

Category	Type	Number of samples tested				Number of samples with interpretable results by both methods					
		2006	2011	2018	Total	2006	2011	2018	Total		
1	Meat and meat products	a	Raw (unseasoned)	6	11	0	17	5	10	0	15

			Total	14	3	6	23	13	3	4	20
All categories				96	51	30	177	71	48	17	135

3.1.1.2 Artificial and natural contamination of the samples

50 samples were artificially contaminated using seeding protocols. The inoculated strains and the injury protocols applied are provided in **Appendix 3**.

43 samples gave interpretable results by both methods.

93 samples giving interpretable results by both methods were naturally contaminated.

68.4 % of the samples were naturally contaminated.

3.1.1.3 Raw data

The raw data are provided in **Appendix 4**.

The samples were analyzed by the reference and the alternative methods in order to have 15 interpretable results per category, and 5 interpretable results per tested type.

The data are classified in three categories (See **Table 3**):

- Interpretable results with the reference and the alternative methods;
- Results with less than 4 colonies per plate with the reference and/or the alternative method (indicated with "*" in the data) in order to have a more precise result. These results were not included in the calculation.
- Results below or above the quantification limit: according to the ISO 16140-2:2016, if any result (either reference or alternative method) is below the quantification limit, the data should be plotted using a substituted value of 1 log₁₀ unit less than the observed value. Similarly, any value greater than the upper limit should be amended by adding log₁₀ unit more. These results are not included in the calculations but also appear on the graphs.

Table 3 - Classification of the data

Category		Type	Number of samples tested	Number of interpretable results by both methods	Number of samples with <4 CFU/plate	Number of samples with results below or above the quantification limit
1	Meat and meat products	a Raw (unseasoned)	17	15	2	2
		b Raw and cooked delicatessen	24	19	2	1
		c RTE, RTRH	9	7	1	0
		Total	50	41	5	3
2	Milk and dairy products	a Raw milk	7	6	0	1
		b Cream, desserts and cheeses	14	6	1	7
		c Milk powder	8	5	1	2
		Total	29	17	2	10
3	Seafood products	a Raw fish	15	9	1	5
		b Smoked and marinated	5	5	0	0
		c RTE, RTRH	21	19	0	2

*: Results with less than 4 colonies per plate with the reference and/or the alternative method

♦ Analyses performed according to the COFRAC accreditation

3.1.1.4 Statistical interpretation

The calculations are provided in **Appendix 5**.

The obtained data were analyzed using the scatter plot. The graphs are provided with the line of identity ($y = x$).

The **Figures 1 to 5** show the data plotted for each individual category.

The **Figure 6** shows the data plotted for all the products.

Figure 1 - Data plotted for the Meat and meat products

Figure 2 - Data plotted for Milk and dairy products

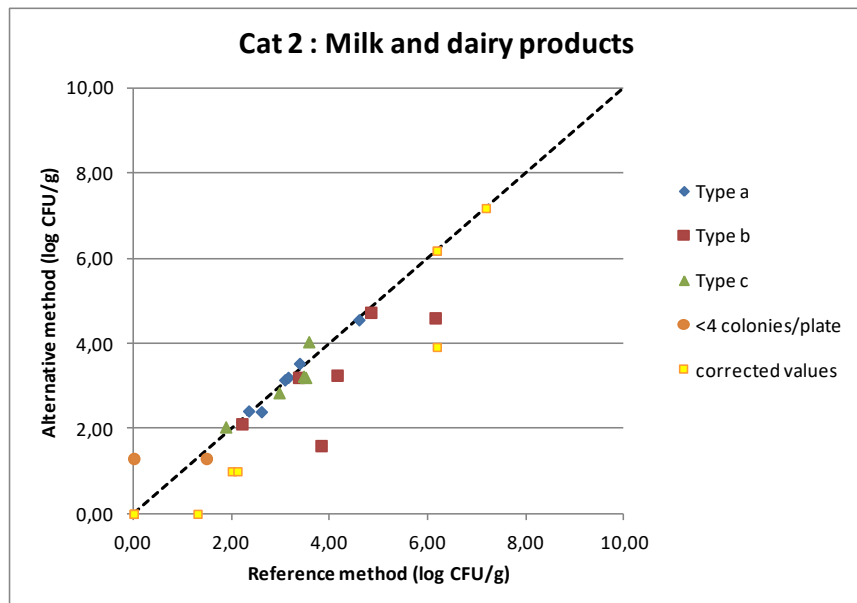

Figure 3 - Data plotted for **Seafood products**

Figure 4 - Data plotted for **Vegetables**

Figure 5 - Data plotted for **Eggs and egg-based products**

Figure 6 - Data plotted for all the products

The calculated values for Average difference and Standard deviation differences per category are provided in **Table 5**.

Table 5 - Calculated values

Category		Number of samples with interpretable results	\bar{D}	SD	Lower limit (95%)	Upper limit (95%)
1	Meat and meat products	41	-0.28	0.43	-1.16	0.60
2	Milk and dairy products	17	-0.29	0.67	-1.75	1.18
3	Seafood products	33	-0.08	0.35	-0.81	0.64
4	Vegetables	24	-0.06	0.38	-0.87	0.74
5	Eggs and egg-based products	20	-0.11	0.22	-0.58	0.36
All categories		135	-0.17	0.42	-1.01	0.67

\bar{D} : Average difference

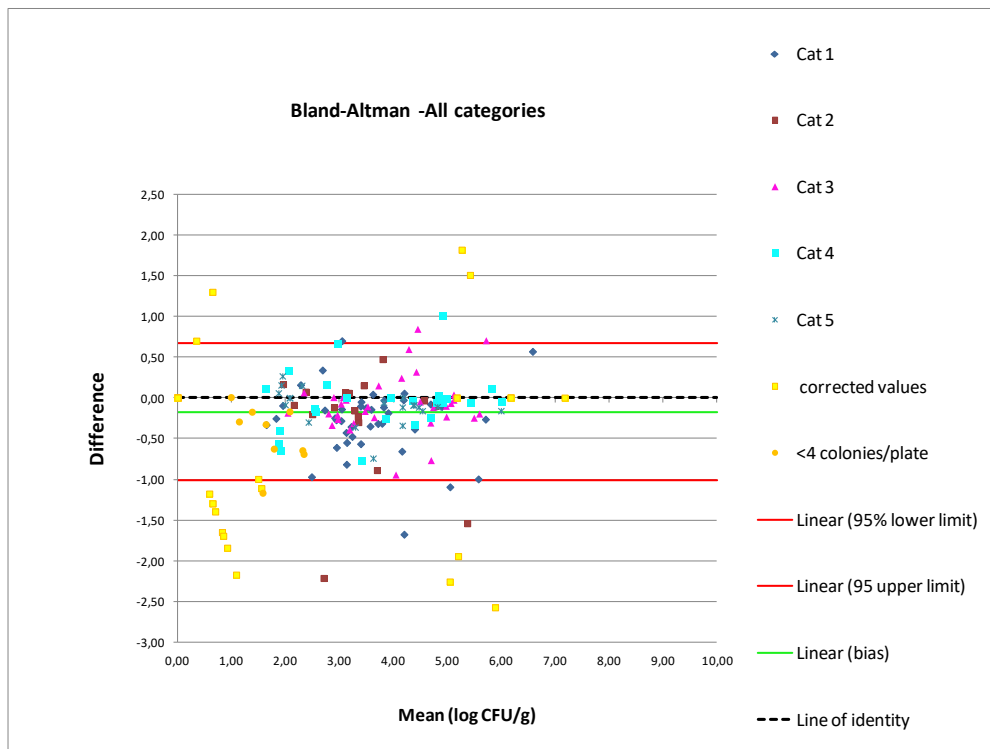

SD: Standard deviation of differences

The average differences vary from - 0.29 log (dairy products) to - 0.06 log (vegetables).

The bias between both methods for all categories combined is -0.17 log CFU.

The Bland-Altman difference plot combining all the samples is given **Figure 7**.

Figure 7 – Bland-Altman difference plot for all the samples

Samples for which the difference between the result observed with the reference and the alternative methods is higher or lower than the limits are listed in **Table 6**.

Table 6 - Analysis of the data out of the confidence limits

Classification of the data	CHROMID® (COLI ID-F) for the enumeration of coliforms									
	Category	Type	Sample N°	Product	Reference method	Alternative method	Values before correction (reference and/or alternative)	Mean	Difference	CLs
Interpretable results	1	a	1913	Ground turkey meat	5.04	3.36	/	4.20	-1.68	-1,01 / 0,67

	2	b	1273	Strawberries ice cream	0.00	1.30	1.00	0.65	1.30	
	3	a	1653	Mackerel	0.00	0.70	1.00	0.35	0.70	
4	a	1275	Green beans	4.36	6.18	5.18	5.27	1.82		
4	a	1277	Green pepper	4.67	6.18	5.18	5.43	1.51		

Values in green: differences in favour of the alternative method Values in red: differences in favour of the reference method Values in black: equivalent enumeration observed for the two methods

 Corrected value
 Results calculated using plates with less than 4 colonies

The values outside of the confidence limits at 95 % concern:

- 8 samples with interpretable results by both method (4 samples below the LCL and 4 samples above the UCL)
- 1 sample with less than 4 colonies on the plate (CHROMID Coli);
- 17 samples below or above the quantification limits (5 for the reference method, 12 for the alternative method).

3.1.1.5 Discordant results

The number of samples below or above the CLs is given **Table 7**).

Table 7 – Number of samples outside the CLs

		Number of samples
Interpretable results by both methods	< LCL	4
	> UCL	4
	Total	8
<4 CFU/plate	< LCL	1
	> UCL	0
	Total	1
< or > the quantification limit	< LCL	13
	> UCL	4
	Total	17
Total < LCL		18
Total >UCL		8
TOTAL		26

For samples giving interpretable results by both methods, the number of samples with higher enumeration with the reference method is the same than the number of samples with higher enumeration using the alternative method (4 samples)

For the samples giving results below or above the quantification limit, more samples are below the LCL (13 vs 4) but note that for a majority of these samples, the difference is linked to the fact that a substituted value was used for the calculation. For 11 samples outside of the confidence interval limits, the results can be considered equivalent.

The bias between the tested methods is low (-0.17log CFU).

3.1.1.6 Conclusion

The relative trueness of the alternative method is satisfying. The alternative method is equivalent to the reference method.

3.1.2 Accuracy profile study

The accuracy profile is a graphical representation of the capacity of measurement of the quantitative method, obtained by combining acceptability intervals and β -expectation tolerance intervals, both reported to different levels of the reference value.

3.1.2.1 Matrices

Five matrices were tested. A minimum of one type per category, and 2 different batches, was selected, using 6 samples per type. 2 samples were contaminated at a low level, 2 at intermediate level, 2 at a high level. For each sample, 5 replicates (5 different test portions) were tested. The tested categories, types, matrix and inoculated strains are provided in **Table 8**.

Table 8 - Categories, types and matrices

Category		Type	Matrix	Inoculated strain	Origin	Inoculation level (CFU/g)
1	Meat products and meat	a Raw meat	Ground beef	<i>Klebsiella oxytoca</i> 42	Food product	300 50000 100000
2	Milk and dairy products	b Dessert	Vanilla dairy-based dessert	<i>Enterobacter agglomerans</i> 74	Cheese	
3	Seafood products	a Raw fish	Raw fish fillet	<i>Enterobacter cloacae</i> Ad230	Tuna	
4	Vegetables	c RTE, RTRH	Grated carrots	<i>Escherichia coli</i> 19	Grated carrots	
5	Eggs and egg based products	a Eggs	Liquid egg product	<i>Cronobacter sakazakii</i> Ad890	Liquid egg product	

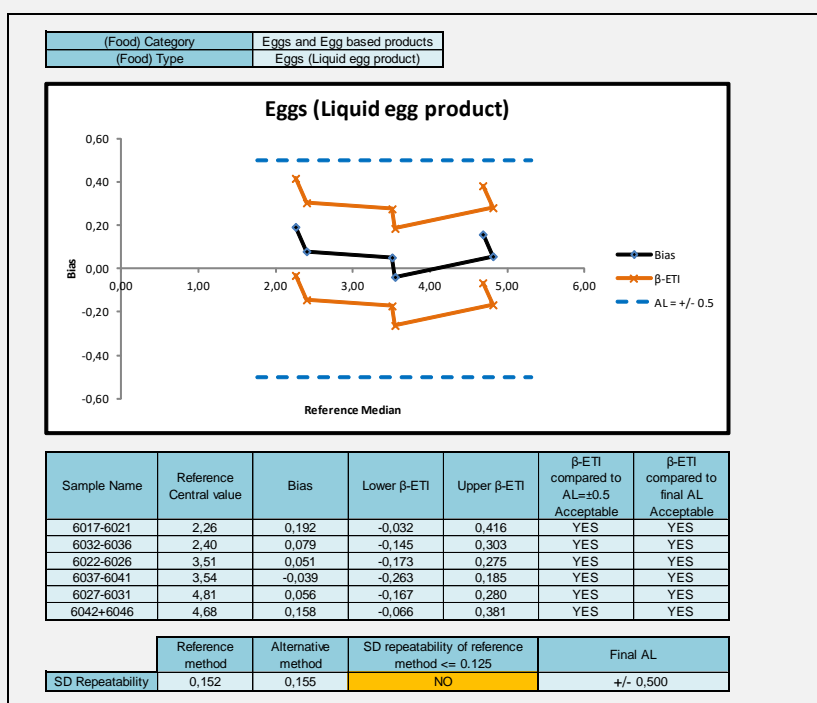

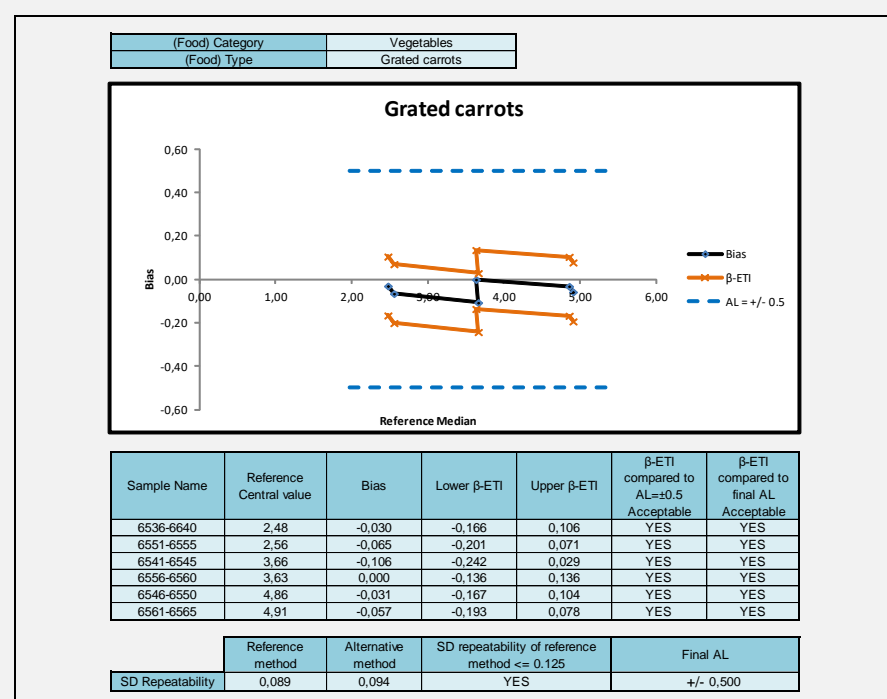

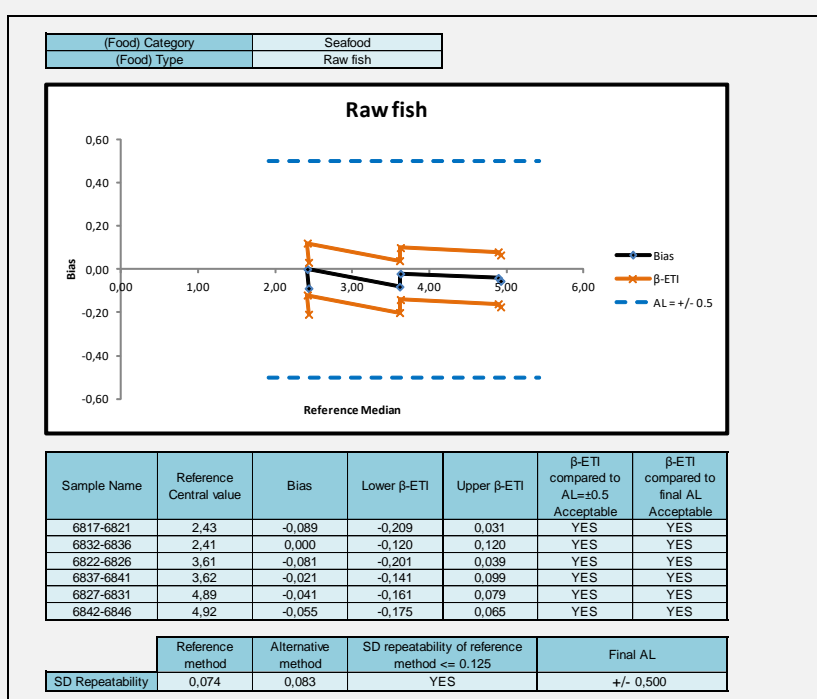

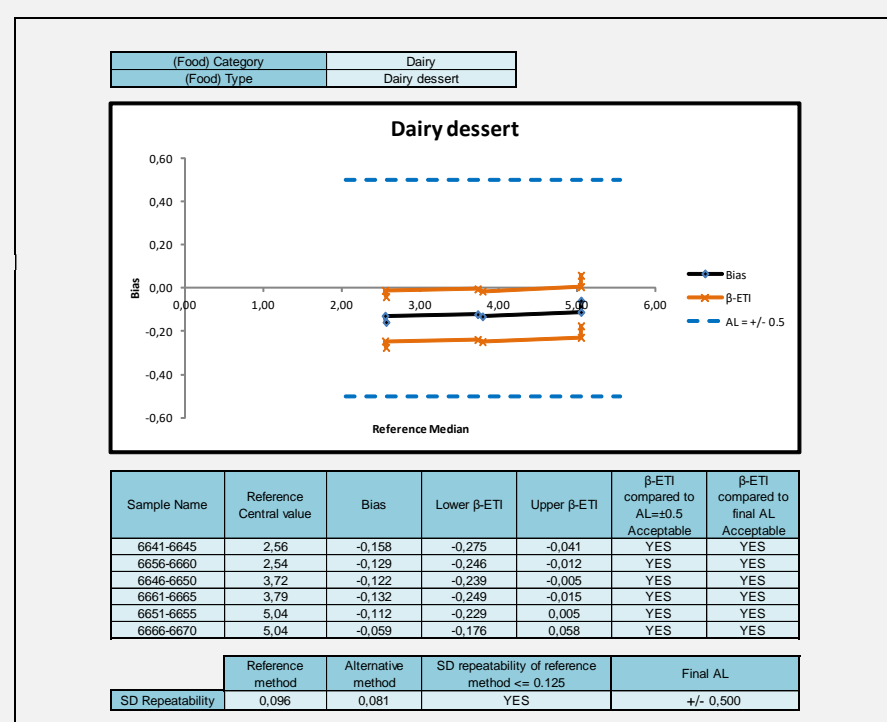

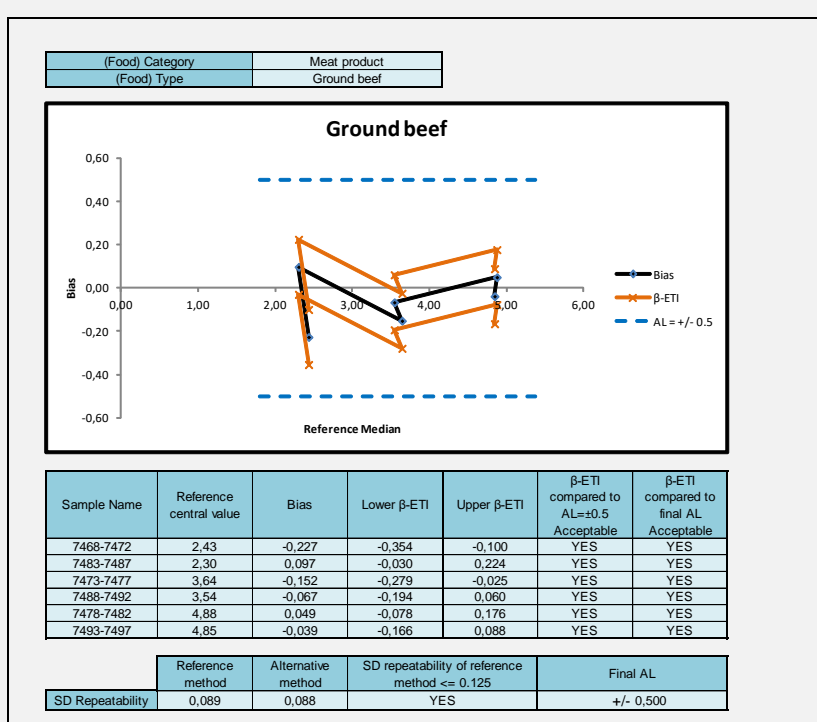

3.1.2.2 Calculation and interpretation

The raw data are provided in **Appendix 6**. The summary tables (in log CFU/g) and calculations are provided in **Appendix 7**. The statistical results and the accuracy profiles are provided **Figure 8**.

The calculations were done using the AP Calculation Tool MCS (Clause 6-1-3-3 calculation and interpretation of accuracy profile study) ver 31-07-2018 available on <http://standards.iso.org/iso/16140>

The accuracy profiles are comprised within the Acceptability Limits for all the tested matrices.

Figure 8 – Accuracy profile

3.1.2.3 Conclusion

For the five matrices tested the observed profiles are comprised within the AL fixed at ± 0.5 log. All the accuracy profiles fulfil the performance criteria.

3.1.3 Inclusivity and exclusivity studies

The inclusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

For the initial validation study (2006), 30 target and 20 non-target strains were tested in duplicate on PCA, VRBL and CHROMID Coli (37°C).

20 additional target strains and 10 non-target strains were tested in 2017, once on PCA, VRBL and CHROMID Coli (37°C).

The raw data are provided in **Appendix 8**.

> **Inclusivity**

Among the 50 target strains tested 5 gave non-typical colonies using the CHROMID Coli:

- *Escherichia fergusonii* Ad 1381
- *Serratia liquefaciens* Ad2601
- *Serratia proteomaculans* Ad 1698
- *Serratia marcescens* Ad 2604
- *Serratia fonticola* Ad 1696

> **Exclusivity**

30 non target strains were tested, 5 strains gave typical colonies on CHROMID Coli plates and VRBL plates

- *Kluyvera ascorbata* Ad 229
- *Leclercia adecarboxylata* Ad 707
- *Lelliottia amnigena* Ad 1379
- *Pantoea agglomerans* A00L065
- *Raoultella terrigena* Ad 1370

Two additional strains gave typical colonies only on VRBL plates:

- *Buttiauxella agrestis* Ad 1328
- *Yersinia enterocolitica* Ad 1028

The CHROMID Coli method is as specific and selective, as the reference method.

3.1.4 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

Storage conditions, shelf-life and modalities of utilisation after first use	The bottles are stored in their boxes at 2°C -8°C until the expiry date and kept away from light The agar cannot be melted more than twice		
Time to result	Steps	Reference method	Alternative method
	Sampling analysis	D0	D0
	Enumeration	D1	D1
Common step with the reference method	Preparation of initial suspension		

The enumeration of coliforms is available in one day for both methods.

3.2 Inter-laboratory study organisation and results

The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

The study was run in 2006.

Pasteurised half-skimmed milk inoculated with *Escherichia coli* 94 and *Enterobacter cloacae* Fb2 was used for the study.

14 laboratories participated in the study.

The results of the inter-laboratory study run in 2006 were interpreted according to the EN ISO 16140-2:2016 standard using the Excel spread sheet available at <http://standards.iso.org/iso/16140> (AP Calculation tool ILS (clause 6.2.3 Calculation summary and interpretations of data) ver 14.03.2016).

3.2.1 Experimental parameters controls

3.2.1.1 Sample stability

Strain stability during transport

Two samples inoculated per inoculation level were tested for enumeration after 24 h and 48 h storage at $3^{\circ}\text{C} \pm 2^{\circ}\text{C}$ (See **Table 9**)

Table 9 – *Enterobacter cloacae* Fb2 and *Escherichia coli* 94 stability in the matrix

	Level 1		Level 2		Level 3	
	Replicate 1	Replicate 2	Replicate 1	Replicate 2	Replicate 1	Replicate 2
Day 0	71	87	720	760	8 100	8 000
Day 1	72	78	810	640	9 300	6 600
Day 2	63	55	880	770	7 500	6 600

No evolution was observed during storage for 48 h at $3^{\circ}\text{C} \pm 2^{\circ}\text{C}$.

3.2.2 Logistic conditions

The temperatures measured at reception by the Labs, the temperatures registered by the thermo-probe, and the receipt dates are given in **Table 10**.

Table 10 - Sample temperatures at receipt

Collaborator	Temperature measured at receipt (°C)	Date and hour receipt of the samples		Temperature measured by the probe (°C)
A	7.5	Day 2	14h00	0.5
B	2.0	Day 1	11h15	0.0
C	4.0	Day 1	11h30	<i>Probe not received</i>
D	3.0	Day 1	08h30	0.0
E	2.5	Day 2	09h10	0.0
F	0.3	Day 1	11h20	- 2.5 ¹
G	4.6	Day 1	10h00	0.00
H	0.2	Day 1	08h15	0.00
I	0.4	Day 1	09h30	0.00
J	1.0	Day 1	11h30	- 1.00 ¹
K	0.6	Day 1	09h20	0.00
L	0.3	Day 1	13h15	0.00
M	0.0	Day 1	11h00	0.00
N	0.3	Day 1	08h45	0.00

All the packages were declined at Day 1 except for two labs (A and E) which received their sample at Day 2. All the temperature measured at receipt were correct or below 8.4°C. No problem was encountered during transport.

3.2.3 Result analysis

3.2.3.1 Results obtained by the expert Lab.

The results obtained by the expert Lab. are the following (See **Table 11**).

Table 11 – Results obtained by the expert Lab.

Level (log CFU/g)	Reference method		Alternative method	
	Replicate 1	Replicate 2	Replicate 1	Replicate 2
< 1	< 1	< 1	< 1	< 1
1 to 2	1,97	1,92	1,92	1,85
2 to 3	2,90	2,75	2,90	2,82
3 to 4	3,98	3,89	3,89	3,92

¹ Some temperatures below 0°C were noticed but the samples were not frozen.

3.2.3.2 Results obtained by the collaborators

Samples were sent to 14 collaborators.

Mesophilic aerobic microflora

The mesophilic aerobic microflora was done on the matrix with ISO 4833 method.
The results varied from 22 000 to 480 000 CFU/ml.

Coliforms enumeration

A summary of the test results is given in **Table 12** (CFU/g) and **Table 13** (log CFU/g).

Table 12 - Summary of data (CFU/g)

Some labs enumerated the dilution -1, -2, -3 instead of the dilution 0, -1, -2, -3 this explains the results obtained for level 0 (< 1 or < 10 CFU/ml).

3.2.4 Calculation and interpretation

3.2.4.1 Visual linearity checking

The **Figure 9** shows the data points after \log_{10} transformation. The visual inspection shows that the alternative method gives results, which are proportional to those of the reference method. The data are distributed closely to the first bisecting lines with a slope equal to 1.

Figure 9 - Visual linearity checking

3.2.4.2 Accuracy profile calculation

Statistical calculations were done according to the Excel spreadsheet available on <http://standards.iso.org/ISO/16140>. A summary of the statistical test is provided in **Table 14**.

Table 14 - Summary of statistical tests

Accuracy profile						
0,5						
Study Name	CHROMID Coli					
Date	2006					
Coordinator	ADRIA Développement					
Tolerance probability (beta)	80%	80%	80%			
Acceptability limit in log (lambda)	0,50	0,50	0,50			
Application of clause 6.2.3 Step 8: If any of the values for the β -ETI fall outside the acceptability limits, calculate the pooled average reproducibility standard deviation of the reference method. Step 9: Calculate new acceptability limits as a function of this standard deviation.						
Alternative method				Reference method		
Levels	Low	Medium	High	Low	Medium	High
Target value	1,866	2,906	3,931			
Number of participants (K)	14	14	14	14	14	14
Average for alternative method	1,863	2,881	3,905	1,866	2,906	3,931
Repeatability standard deviation (sr)	0,105	0,054	0,052	0,082	0,059	0,039
Between-labs standard deviation (sL)	0,000	0,045	0,042	0,074	0,033	0,078
Reproducibility standard deviation (sR)	0,105	0,070	0,067	0,111	0,068	0,087
Corrected number of dof	26,963	22,584	22,749	21,761	25,138	15,871
Coverage factor	1,337	1,353	1,352			
Interpolated Student t	1,314	1,320	1,320			
Tolerance interval standard deviation	0,1067	0,0719	0,0684			
Lower TI limit	1,723	2,786	3,815			
Upper TI limit	2,003	2,976	3,996			
Bias	-0,003	-0,025	-0,026			
Relative Lower TI limit (beta = 80%)	-0,143	-0,120	-0,116			
Relative Upper TI limit (beta = 80%)	0,137	0,070	0,065			
Lower Acceptability Limit	-0,50	-0,50	-0,50			
Upper Acceptability Limit	0,50	0,50	0,50			
New acceptability limits may be based on reference method pooled variance						
Pooled repro standard dev of reference	0,090					

These values are collected in a graphical representation together with the acceptability limits (AL). This representation is given **Figure 10**.

Figure 10 - Accuracy profile

It is observed that for all the levels, the tolerance interval limits of the alternative method are within the acceptable limits of ± 0.5 log.

The results obtained with the alternative method are not statically different than those obtained with the reference method.

3.2.4.3 Conclusion

The alternative method is equivalent to the reference method.

4 CONCLUSION

The observed data and interpretation confirm the performances of the alternative method:

- 177 samples were tested in the relative trueness study, providing 135 interpretable results by both methods which clearly satisfied the required criteria for quantitative method comparison per ISO 16140-2.
- The observed profiles are comprised within the AL set at ± 0.5 Log CFU/g in the EN ISO 16140-2:2016.
- The inclusivity and exclusivity testing shows satisfying results.
- The quality assurance parameters were verified (targeted levels, strain stability, logistic conditions, analyses), confirming that the inter-laboratory study was conducted in appropriate conditions.
- The data interpretations were done according to the EN ISO 16140-2:2016. For the three contamination levels, the alternative method is accepted as equivalent to the reference method.

Based on the results obtained for the method comparison study and the inter-laboratory study, the alternative method is considered equivalent to the reference method.

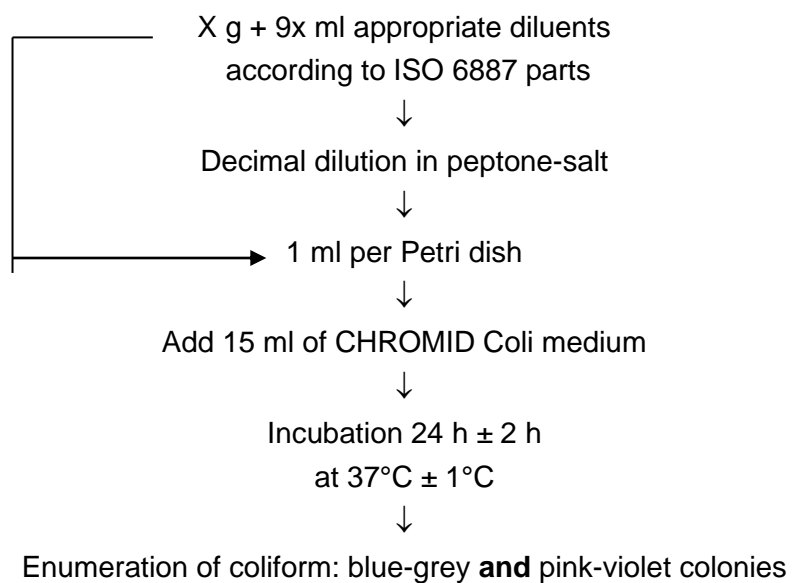

Quimper, 03 November 2022

Maryse RANNOU
Project Manager
Validation of Alternative methods

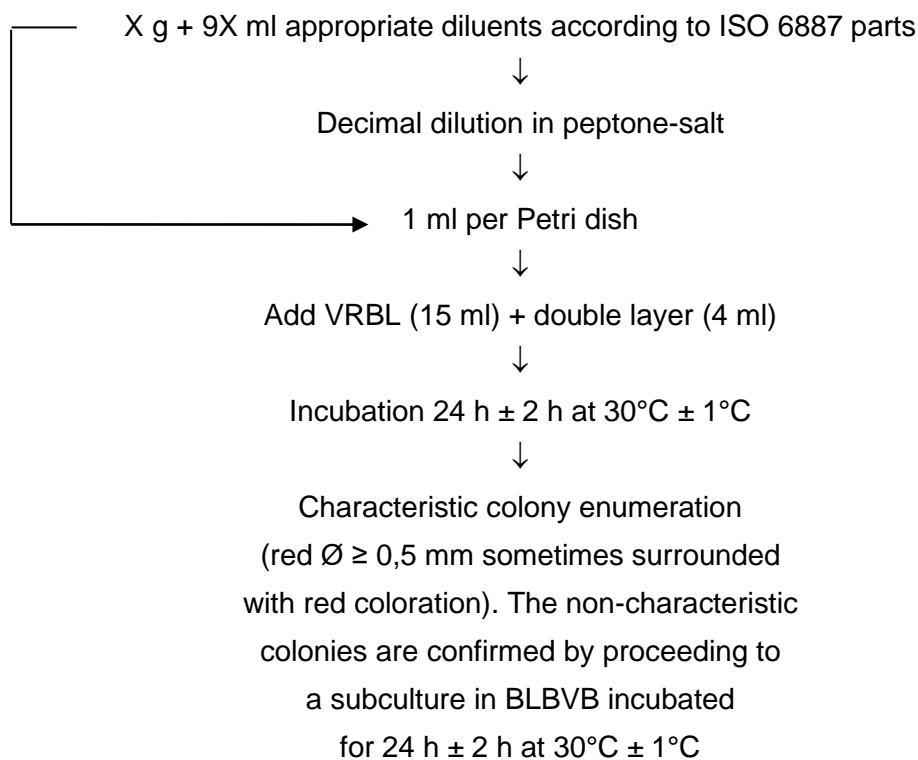

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).
