## 1 INTRODUCTION

---

The RAPID' *L.mono* detection was validated with the certificate number BRD 07/04 - 09/98. The validation stages are as follows:

Date	Validation stage	Reference method	Validation protocol
September 1998	Initial validation for human food	EN ISO 11290-1:1996	AFNOR current requirements
September 1999	Extension for a modification of the medium formula (modification of lithium chlorure concentration)	EN ISO 11290-1:1996	AFNOR current requirements
November 2002	Renewal/extension with modification of the protocol	EN ISO 11290-1:1996	AFNOR current requirements
September 2006	Renewal and extension (modification of formula of the medium), extension for <i>Listeria</i> spp. detection	NF EN ISO 11290-1/A1:2005	NF EN ISO 16140:2003
September 2008	Extension for a new confirmation test: Rhamnose test	NF EN ISO 11290-1/A1:2005	NF EN ISO 16140:2003
July 2010	Renewal	NF EN ISO 11290-1/A1:2005	NF EN ISO 16140:2003
July 2014	Renewal	NF EN ISO 11290-1/A1:2005	NF EN ISO 16140:2003
July 2019	Renewal and extension (new confirmation protocol for <i>Listeria</i> spp detection by spot onto Palcam or AL (O&A) plates)	ISO 11290-1:2017	NF EN ISO 16140-2:2016
June 2023	Renewal	ISO 11290-1:2017	NF EN ISO 16140-2:2016

## 2 METHOD PROTOCOLS

---

### 2.1 Alternative method

The flow diagram of the alternative method is provided in **Appendix 1**.

#### 2.1.1 Principle

The method enables plating any colony isolation on a single medium (RAPID' *L.mono*) after a primary sample enrichment. The RAPID' *L.mono* is an agar plate for specific detection of *Listeria monocytogenes* by chromogenic detection of PIPLC activity (Phosphatidyl-Inositol Phospholipase C) in *Listeria monocytogenes* and *Listeria ivanovii*, which form blue colonies and in the other *Listeria* species which form white colonies.

Xylose fermentation is used to differentiate *L. ivanovii* (xylose positive: forms a yellow halo around the colony) from *L. monocytogenes* (xylose negative: no halo around the colony).

### 2.1.2 Protocol

The validated protocol is the following:

- Enrichment in half Fraser for **24 h ± 2 h** at  $30^{\circ}\text{C} \pm 1^{\circ}\text{C}$  (dilution 1/10), for 25 g or 25 mL test portion size;
- Spreading-streaking of 0.1 ml onto RAPID'*Lmono* Agar (RLM) and incubation for  $24 \text{ h} \pm 2 \text{ h}$  at  $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$  for *Listeria monocytogenes* detection and  $48 \text{ h} \pm 2 \text{ h}$  at  $37^{\circ}\text{C} \pm 1^{\circ}\text{C}$  for *Listeria* spp. detection.
- Confirmation of typical colonies:
  - > For ***Listeria monocytogenes*** (blue colonies without a yellow halo using one of the following protocol):
    - According to classical tests described in methods standardized by CEN or ISO from isolated RAPID'*Lmono* colonies,
    - Using nucleic probes described in EN ISO 7218 standard (including or not the purification step): iQ-Check *Listeria monocytogenes* II,
    - By carrying out Rhamnose test,
    - By implementing any other AFNOR validated method based on a principle different from the RAPID'*Lmono* Agar (respecting specifications in the manufacturer's test instructions).
  - > For ***Listeria* spp.** other than *L. monocytogenes* (blue-green colonies with a yellow halo, white or pale yellow with or without a yellow halo):
    - According to classical tests described in methods standardized by CEN or ISO from isolated RAPID'*Lmono* colonies,
    - Using nucleic probes described in EN ISO 7218 (including or not the purification step): for example, iQ-Check *Listeria* spp;
    - By implementing any other AFNOR validated method based on a principle different from the RAPID'*Lmono* test (respecting specifications in the manufacturer's test instructions),
    - By spot on Palcam from an isolated colony
    - By spot on Agar Listeria AL (O&A) from an isolated colony

It is possible to store the enrichment broth for 72 h at  $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$  after incubation before streaking onto RAPID'*Lmono* plate.

It is also possible to store the RAPID'*Lmono* plates for 72 h at  $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$  after incubation before observation.

### 2.1.3 *Restrictions*

There is no restriction.

## 2.2 Reference method♦

The reference method used for the renewal study was the ISO 11290-1 (May 2017): Microbiology of the food chain - Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria* spp. - Part 1: detection method.

The flow diagram is given in **Appendix 2**.

## 2.3 Study design

The study is a **paired study design** as the reference and the alternative methods have the same enrichment procedure.

## **3 INITIAL VALIDATION, EXTENSION/RENEWAL STUDIES: RESULTS**

### 3.1 Method comparison study

*The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.*

*The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.*

*For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.*

#### 3.1.1 Sensitivity study

*The sensitivity (SE) is the ability of the method to detect the analyte by either the reference or alternative method.*

### 3.1.1.1 *Listeria spp.* detection

#### 3.1.1.1.1 Number and nature of samples

Taking into account all the data, 500 samples were tested providing 208 positive and 292 negative results.

The number of samples tested per category and type is given in Table 1.

**Table 1 – Distribution per tested category and type (*Listeria spp.*)**

Category		Type	Positive	Negative	Total
1	Composite foods	a   RTE	15	7	22
		b   RTRH	10	14	24
		c   Pastries, egg products	10	10	20
		Total	35	31	66
2	Meat products	a   Raw	14	14	28
		b   RTE, RTRH	9	11	20
		c   Delicatessen	19	15	34
		Total	42	40	82
3	Dairy products	a   Raw milk cheeses	8	17	25
		b   Raw milk	8	12	20
		c   Heat treated dairy products	16	47	63
		Total	32	76	108
4	Fishery products	a   Raw fish	10	28	38
		b   Smoked and seasoned fish	14	13	27
		c   RTE, RTRH	8	12	20
		Total	32	53	85
5	Vegetables	a   Fresh and frozen vegetables	11	12	23
		b   Pre-cooked, MAP	13	15	28
		c   RTE, RTRH	8	14	20
		Total	32	41	73
6	Environmental samples	a   Process water	8	12	20
		b   Sponges, swabs	15	25	40
		c   Dusts, residues	12	14	26
		Total	35	51	86
All categories			208	292	500

#### 3.1.1.1.2 Artificial contamination of samples

Artificial contaminations were done using spiking or seeding protocols (See **Appendices 3 and 4**). Strains were injured using different protocol and the injury level was evaluated by comparing enumeration done onto selective media (Palcam) and non-selective media (TSYEA).

232 samples were artificially contaminated; 130 gave a positive result.

The repartition of the positive samples per inoculation protocol and inoculation level is given in Table 2.

**Table 2 - Repartition of the positive samples per inoculation protocol and inoculation level (*Listeria* spp.)**

	Naturally contaminated	Cross contamination	Spiking protocol			Seeding protocol			Total
			≤5	5< CFU ≤10	10< CFU≤ 30	≤3	3< CFU ≤10	10< CFU≤ 30	
Number of samples	112	0	22	26	15	31	2	0	208
%	53,8%	0,0%	10,6%	12,5%	7,2%	14,9%	1,0%	0,0%	100%

13,5 % of the samples were contaminated between 3 CFU (seeding) or 5 CFU (spiking) and 10 CFU.

**53,8 % of the samples were naturally contaminated with *Listeria* spp.**

According to the AFNOR technical rules, the number of samples contaminated with *Listeria* spp. alone or mixed with *Listeria monocytogenes* per category has to be comprised between 15 and 25 samples. The repartition per target analyte is given in Table 3.

**Table 3 - Distribution per target analyte (*Listeria* spp.)**

Category	<i>Listeria</i> spp (A)	Mix (B)	<i>Listeria monocytogenes</i> (C)	Total A + B
1	14	8	13	22
2	17	25	0	42
3	15	7	10	22
4	14	9	9	23
5	23	9	0	32
6	13	21	1	34
<b>Total</b>	<b>96</b>	<b>79</b>	<b>33</b>	<b>175</b>

For each category, the number of samples contaminated with *Listeria* spp. alone or mixed with *L. monocytogenes* is, comprised between 15 and 25.

### 3.1.1.1.3 *Protocols applied during the validation study*

#### > Incubation time

The Half-Fraser broths were incubated for 22 h at 30°C ± 1°C.

The RAPID'L.*mono* plates were incubated for 22 h and 48 h at 37°C. The interpretation of the data was done after 48h incubation of the plates but raw data for both incubation times are provided in the report.

#### > Confirmations

The typical colonies (blue, blue-green, white or pale yellow with or without halo) were confirmed by the tests described in the ISO 11290-1 method after purification step (Gram, β-haemolysis catalase).

#### > Plates storages

For the initial validation study, the RAPID'L.*mono* plates were stored for 48 h at 5°C ± 3°C; for the renewal study they were stored for 72 h at 5°C ± 3°C.

#### > Half-Fraser storage

The Half-Fraser broths from positive and discordant samples were stored for 72 h at 5°C ± 3°C.

### 3.1.1.1.4 *Test results*

Raw data per category are given in **Appendix 5**. A summary of the results is given in Table 4. The interpretation is given for 48 h incubation time.

**Table 4 – Interpretation of sample results between the reference and alternative method (based on the confirmed alternative) – *Listeria* spp.**

Category		RAPID'L.mono 48h						Total

All categories		195	286	5	8	0	6	96,2	97,6	97,4	2,1	

A summary of the results is given in Table 6.

**Table 6 - Summary of results (*Listeria* spp.)**

		RAPID'L. <i>mono</i> 48h
<b>Sensitivity for the alternative method</b>	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100\%$	96.2 %
<b>Sensitivity for the reference method</b>	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100\%$	97.6 %
<b>Relative trueness</b>	$RT = \frac{(PA + NA)}{N} \times 100\%$	97.4 %
<b>False positive ratio for the alternative method*</b> FP = PPNA + PPND	$FPR = \frac{(FP)}{NA} \times 100\%$	2.1 %

With      ND = ND + PPND  
               NA = NA + PPNA

#### 3.1.1.1.6 Analysis of discordant results

The negative deviations are given in Table 7 and the positive deviations in Table 8.

Table 7 - Negative deviations (*Listeria* spp.)

◆ Analyses performed according to the COFRAC accreditation

2006	S11	Swab stand delicatessen	/	/	-	/	+	+	<i>L.innocua</i>	PD	PD	6	b

Eight negative deviations were observed: 5 concern naturally contaminated samples and 3 artificially contaminated samples.

For two samples (N1: cabbage, carrots and Q9: cheese), *Listeria innocua* and *Listeria seeligeri* were respectively recovered after Half Fraser broth storage for 72 h at 5°C ± 3°C.

For most of these samples, typical colonies were observed after Fraser broth streaking onto selective agar plates for the reference method. The samples were probably contaminated at a very low level.

Five positive deviations were observed: 2 concern samples artificially contaminated and 3 naturally contaminated samples. Note that for one sample (O6: smoked trout), streaking performed after Half Fraser broth storage for 72 h at 5°C ± 3°C gave negative results.

The analyses of discordant results according to the EN ISO 16140-2:2016 is given in Table 9 for 48 h incubation time.

**Table 9 - Analyses of discordant results – 48 h incubation time (*Listeria* spp.)**

The observed values for ND+PPND-PD and for ND+PPND+PD meet the acceptability limit (AL) for each individual category and for all the categories combined.

### 3.1.1.1.7 RAPID'L.mono Agar plates storage

All the plates were stored for 48 h at 5°C ± 3°C for the study performed in 2006 and 72h at 5°C ± 3°C for the renewal study performed in 2019.

No modification of the results was observed after storage, except the fact that for 5 samples, doubtful colonies were observed on the plates just after 48 h incubation time. These colonies were no more visible after plates storage.

### 3.1.1.1.8 Half Fraser broth storage for 72 h at 5°C ± 3°C

The Half Fraser broths from positive and discordant samples were stored for 72 h at 5°C ± 3°C and streaked again onto RAPID'L.mono plates incubated for 48 h at 37°C ± 1°C.

Seven modifications were observed (See Table 10).

**Table 10 – Results before and after storage of Half-Fraser broth for 72 h at 5°C ± 3°C (*Listeria* spp.)**

The observed values for ((ND+PPND)-PD) and for ((ND+PPND) + PD) meet the acceptability limit (AL) for each individual category and for all combined categories.

### 3.1.1.1.9 Confirmation

Confirmations were performed using the tests described in the reference method (Gram, Catalase), by biochemical identification from isolated colony without purification step.

For 6 samples, doubtful colonies were observed on RAPID'L.mono plates after 48h incubation time. These strains were not confirmed as *Listeria* spp.

### 3.1.1.2 *Listeria monocytogenes* detection

#### 3.1.1.2.1 Number and nature of samples

Taking into account all the data, 566 samples were tested providing 274 positive and 290 negative results.

The number of samples tested per category and type is given in Table 12.

**Table 12 – Distribution per tested category and type (*Listeria monocytogenes*)**

Category		Type		Positive	Negative	Total
1	Composite foods	a	RTE	14	8	22

		Total		64	52	116
All categories				274	292	566

#### 3.1.1.2.2 Artificial contamination of samples

Artificial contaminations were done using spiking or seeding protocols (See **Appendices 3 and 6**). Strains were injured using different protocol and the injury level was evaluated by comparing enumeration done onto selective media (Palcam) and non-selective media (TSYEA).

128 samples were artificially contaminated; 71 gave a positive result.

The repartition of the positive samples per inoculation protocol and inoculation level is given in Table 13.

**Table 13 - Repartition of the positive samples per inoculation protocol and inoculation level (*Listeria monocytogenes*)**

	Naturally contaminated	Cross contamination	Spiking protocol			Seeding protocol			Total
			≤5	5< CFU ≤10	10< CFU≤ 30	≤3	3< CFU ≤10	10< CFU≤ 30	
Number of samples	206	5	14	12	8	29	3	0	275
%	74,9%	1,8%	5,1%	4,4%	2,9%	10,5%	1,1%	0,0%	100%

5.5 % of the samples were contaminated between 3 CFU (seeding) or 5 CFU (spiking) and 10 CFU.

**74.2 % of the samples were naturally contaminated with *Listeria monocytogenes*.**

### 3.1.1.2.3 Protocols applied during the validation study

#### ➤ Incubation time

The Half-Fraser broths were incubated for 22 h at 30°C ± 1°C

The RAPID'L.*mono* plates were incubated for 22 h and 48 h at 37°C.

#### ➤ Confirmations

The typical colonies (blue to blue-green) were confirmed by the tests described in the ISO 11290-1 method after purification step.

#### ➤ Plates storages

For the initial validation study, the RAPID'L.*mono* plates were stored for 48 h at 5°C ± 3°C, for the renewal study they were stored for 72 h at 5°C ± 3°C.

#### ➤ Half-Fraser storage

The Half-Fraser broths from positive and discordant samples were stored for 72 h at 5°C ± 3°C.

### 3.1.1.2.4 Test results

Raw data per category are given in **Appendix 7**. A summary of the results is given in Table 14. The interpretation is given for both incubation times (22 h and 48 h).

**Table 14 – Interpretation of sample results between the reference and alternative method (based on the confirmed alternative) - *Listeria monocytogenes***

All categories			267	291	5	3	0	0	98,9	98,2	98,6	0,0

A summary of the results is given in Table 16.

**Table 16 - Summary of results (*Listeria monocytogenes*)**

		22 h	48 h
Sensitivity for the alternative method	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100\%$	98.2 %	98.9 %
Sensitivity for the reference method	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100\%$	98.5 %	98.5 %
Relative trueness	$RT = \frac{(PA + NA)}{N} \times 100\%$	98.4 %	98.8 %
False positive ratio for the alternative method*	$FPR = \frac{(FP)}{NA} \times 100\%$	3.1 %	0.0 %
FP = PPNA + PPND			

With       $ND = ND + PPND$   
 $NA = NA + PPNA$

The false positive ratio after 22h incubation time of the RLM plates is 3.1% while it is 0% after 48h incubation time. Doubtful colonies were present on the plates after 22h and were clearly negative after 4 h incubation.

### 3.1.1.2.6 Analysis of discordant results

The negative deviations are given in Table 17 and the positive deviations in Table 18.

Table 17 - Negative deviations (*Listeria monocytogenes*)

1998	I1	Salmon	/	/	-	/	+	+	+	<i>L.monocytogenes</i>	PD	PD	PD	4	a

Four negative deviations were observed after 22 h incubation time of RAPID'L.*mono* plates and 3 after 48 h incubation time; one concerned an artificially contaminated sample and three naturally contaminated samples.

For one sample (M4: cod fillet), one characteristic colony was isolated on Palcam plate from Half Fraser broth for the ISO method.

For one sample (2C3: smoked salmon), *Listeria monocytogenes* was detected with the RAPID'L.*mono* method after Half Fraser broth storage for 72 h at 5°C ± 3°C.

Four positive deviations were observed after 22 h incubation time of RAPID'L.*mono* plates and five after 48 h incubation time. All the samples were naturally contaminated.

The analyses of discordant results according to the EN ISO 16140-2:2016 is given in Table 19 for 22 h incubation time and Table 20 for 48 h incubation time.

**Table 19 - Analyses of discordant results – 22 h incubation time

<b>All categories</b>			<b>275</b>	<b>3</b>	<b>0</b>	<b>5</b>	<b>-2</b>	<b>6</b>	<b>8</b>	<b>16</b>

The observed values for ND+PPND-PD and for ND+PPND+PD meet the acceptability limit (AL) for each individual category and for all the categories combined whatever the incubation time tested (22h and 48h).

### 3.1.1.2.7 RAPID'L.mono Agar plates storage

All the plates were stored for 48 h at 5°C ± 3°C for the study performed in 2006 and for 72 h at 5°C ± 3°C for the renewal study.

No modification was observed on the colonies before and after storage.

### 3.1.1.2.8 Half Fraser broth storage for 72 h at 5°C ± 3°C

The Half Fraser broths for positive and discordant samples were stored for 72 h at 5°C ± 3°C and streaked again onto RAPID'L.mono plates incubated for 22 h and 48 h at 37°C ± 1°C.

The following changes were observed (See Table 21).

**Table 21 - Modifications observed after Half-Fraser broth storage for 72 h at 5°C ± 3°C (*Listeria monocytogenes*)**

Sample No	Product	Result before storage		Result after storage		Category	Type
		RLM 22 h	RLM 48 h	RLM 22 h	RLM 48 h		
J10	Seasoned minced meat	PD	PD	NA	NA	2	b

<b>All categories</b>			<b>272</b>	<b>6</b>	<b>0</b>	<b>2</b>	<b>4</b>	<b>6</b>	<b>8</b>	<b>16</b>

**The observed values for ND+PPND-PD and for ND+PPND+PD meet the acceptability limit (AL) for each individual category and for all the categories combined.**

### 3.1.1.2.9 Confirmation

Confirmations were performed using the tests described in the reference method. For nine samples, doubtful colonies were observed on RLM plates after 22 h incubation time; these colonies turned to non characteristics colonies after 48 h incubation time. These samples were considered as positive presumptive negative samples for 22 h incubation time.

## 3.1.2 Relative level of detection

*The relative level of detection is the level of detection at P = 0.50 (LOD<sub>50</sub>) of the alternative (proprietary) method divided by the level of detection at P = 0.50 (LOD<sub>50</sub>) of the reference method.*

The RLOD is defined as the ratio of the alternative and reference methods:

$$RLOD = \frac{LOD_{Alt.}}{LOD_{Ref.}}$$

*The relative detection level is the smallest number of culturable micro-organisms that can be detected in the sample in 50% of occasions by the alternative and reference methods.*

### 3.1.2.1 Listeria spp. detection

#### 3.1.2.1.1 Experimental design

For the initial validation study six matrix/strain pairs were tested using the following protocol:

- 0 CFU/ g or ml, 6 samples;
- Level required to get 0 to 50 % positive samples, 6 samples;
- Level required to get 50 to 75 % positive samples, 6 samples;
- Level required to get 75 to 100 % positive samples, 6 samples.

The samples were analyzed by both methods, and the background microflora was enumerated.

For the renewal study two matrix/strain pairs were tested for the Composite food category using the following protocol:

- 0 CFU/g with 5 replicates;
- A low contamination level providing fractional recovery data, with 20 replicates;
- A higher inoculation level, with 5 replicates.

Finally, eight matrix/strain pairs were tested by the reference and the alternative method (See Table 23).

**Table 23 - Defined (matrix/strain) pairs for the RLOD determination  
(*Listeria spp.*)**

Category	Matrix	Strain	Origin	Storage conditions prior to analysis
Composite food	Tabbouleh	<i>Listeria monocytogenes</i> Ad1495	Deli salad	48 h 3°C ± 2°C

		<i>Listeria innocua</i>		No storage after inoculation

### 3.1.2.1.2 Calculation and interpretation of the RLOD

The raw data are given in **Appendix 8**.

The RLOD calculations were performed using the Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 06.07.2015. The RLOD are given in Table 24 for 48 h incubation time.

**Table 24 – Presentation of RLOD before and after confirmation of the alternative method results – 48 h incubation time (*Listeria spp.*)**

**The RLOD meet the Acceptability Limit (AL) fixed at 1.5 for the matrix/ strain pairs tested whatever the incubation time applied for the RAPID' L.*mono* plates.**

The LOD<sub>50%</sub> calculations according to Wilrich & Wilrich POD-LOD calculation program - version 11, 2022-10-12 test are given in Table 25.

**Table 25 - LOD<sub>50</sub> results (*Listeria spp.*)**

(Strain / matrix) pair	Level of detection at 50% (CFU / sample size) according to Wilrich & Wilrich <sup>1</sup>	
	Reference method	Alternative method – 48 h
Tabbouleh / <i>Listeria monocytogenes</i> Ad1495	0.8 [0.4;1.4]	0.8 [0.4;1.4]
Tabbouleh / <i>Listeria ivanovii</i> Ad2465	0.9 [0.4;1.8]	0.9 [0.4;1.8]
Rillettes / <i>Listeria monocytogenes</i>	0.7 [0.4;1.2]	0.7 [0.4;1.2]
Rillettes / <i>Listeria welshimeri</i>	0.5 [0.3;1.0]	0.5 [0.3;1.0]
Raw milk / <i>Listeria monocytogenes</i>	0.4 [0.2;0.8]	0.4 [0.2;0.8]
Smoked salmon / <i>Listeria monocytogenes</i>	0.7 [0.4;1.3]	0.7 [0.4;1.3]
Red cabbage / <i>Listeria monocytogenes</i> Ad545	0.5 [0.3;1.0]	0.4 [0.2;0.8]
Process water / <i>Listeria monocytogenes</i>	0.2 [0.1;0.4]	0.2 [0.1;0.4]
Process water / <i>Listeria innocua</i>	0.5 [0.3;1.1]	0.5 [0.3;1.1]
<b>Combined results</b>	<b>0.6 [0.5;0.7]</b>	<b>0.6 [0.5;0.7]</b>

**The LOD<sub>50</sub> vary from 0.2 CFU to 0.9 CFU for both reference and alternative methods.**

### 3.1.2.2 *Listeria monocytogenes* detection

#### 3.1.2.2.1 Experimental design

For the initial validation study six matrix/strain pairs were tested using the following protocol:

- 0 CFU/ g or ml, 6 samples;
- Level required to get 0 to 50 % positive samples, 6 samples;
- Level required to get 50 to 75 % positive samples, 6 samples;
- Level required to get 75 to 100 % positive samples, 6 samples.

The samples were analyzed by both methods, and the background microflora was enumerated.

<sup>1</sup> Wilrich, C., and P.-Th. Wilrich: Estimation of the POD function and the LOD of a qualitative microbiological measurement method. AOAC International **92** (2009) 1763 - 1772.

For the renewal study performed in 2019, two matrix/strain pairs were tested, one for the composite food category and one for vegetables. For vegetables, the RLOD was performed again as the RLOD value obtained for the initial validation study did not meet the AL (RLOD = 1.624; AL = 1.5) for the 22 h incubation time. The following protocol was applied:

- 0 CFU/g with 5 replicates;
- A low contamination level providing fractional recovery data, with 20 replicates;
- A higher inoculation level, with 5 replicates.

Finally, six matrix/strain pairs were tested by the reference and the alternative method (See Table 26).

**Table 26 - Defined (matrix/strain) pairs for the RLOD determination  
(*Listeria monocytogenes*)**

Category	Matrix	Strain	Origin	Storage conditions prior to analysis
Composite food	Tabbouleh	<i>Listeria monocytogenes</i> Ad1495	Deli salad	48 h 3°C ± 2°C
Meat products	Rillettes	<i>Listeria monocytogenes</i> 1/2c	Meat product	No storage after inoculation
Dairy products	Raw milk	<i>Listeria monocytogenes</i> 1/2b	Raw milk cheese	No storage after inoculation
Fishery products	Smoked salmon	<i>Listeria monocytogenes</i> 1/2a	Smoked salmon	No storage after inoculation
Vegetables	Red cabbage	<i>Listeria monocytogenes</i> Ad545	Deli salad (cabbage, carrots)	48 h 3°C ± 2°C
Production Environmental samples	Process water	<i>Listeria monocytogenes</i> 1/2c	Back water	No storage after inoculation

### 3.1.2.2.2 Calculation and interpretation of the RLOD

The raw data are given in **Appendix 8**.

The RLOD calculations were performed using the Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 06.07.2015. The RLOD are given in Table 27.

**Table 27 – Presentation of RLOD before and after confirmation of the alternative method results (*Listeria monocytogenes*) – 22 h and 48 h**

Name	AL	RLOD	RLODL	RLODU	b=ln(RLOD)	sd(b)	z-Test statistic	p-value
Tabbouleh / <i>Listeria monocytogenes</i> Ad1495	<b>1,5</b>	1,000	0,403	2,480	0,000	0,454	0,000	1,000
Rillettes / <i>Listeria monocytogenes</i>		1,000	0,435	2,298	0,000	0,416	0,000	1,000
Raw milk / <i>Listeria monocytogenes</i>		1,000	0,382	2,616	0,000	0,481	0,000	1,000
Smoked salmon / <i>Listeria monocytogenes</i>		1,000	0,405	2,472	0,000	0,452	0,000	1,000
Red cabbage / <i>Listeria monocytogenes</i> Ad545		1,000	0,477	2,097	0,000	0,370	0,000	1,000
Process water / <i>Listeria monocytogenes</i>		1,000	0,382	2,616	0,000	0,481	0,000	1,000
<b>Combined</b>		<b>1,000</b>	<b>0,706</b>	<b>1,416</b>	<b>0,000</b>	<b>0,174</b>	<b>0,000</b>	<b>1,000</b>

The LOD<sub>50</sub> % calculations according to Wilrich & Wilrich POD-LOD calculation program - version 11, 2022-10-12 test are given in Table 28.

**Table 28 - LOD<sub>50</sub> results (*Listeria monocytogenes*) - 22 h and 48 h**

(Strain / matrix) pair	Level of detection at 50% (CFU / sample size) according to Wilrich & Wilrich <sup>2</sup>	
	Reference method	Alternative method
Tabbouleh / <i>Listeria monocytogenes</i> Ad1495	0.8 [0.4;1.4]	0.8 [0.4;1.4]
Rillettes / <i>Listeria monocytogenes</i>	0.6 [0.3;1.2]	0.6 [0.3;1.2]
Raw milk / <i>Listeria monocytogenes</i>	0.4 [0.2;0.8]	0.4 [0.2;0.8]
Smoked salmon / <i>Listeria monocytogenes</i>	0.7 [0.4;1.3]	0.7 [0.4;1.3]
Red cabbage / <i>Listeria monocytogenes</i>	0.9 [0.6;1.6]	0.9 [0.6;1.6]
Process water / <i>Listeria monocytogenes</i>	0.2 [0.1;0.4]	0.2 [0.1;0.4]
<b>Combined results</b>	<b>0.6 [0.5;0.8]</b>	<b>0.6 [0.5;0.8]</b>

### 3.1.2.3 Conclusion

The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 1.5 for paired studies, for all matrix/strain pairs tested. The LOD<sub>50</sub> varies from 0.2 to 0.9 CFU/sample size for the reference and the alternative methods.

<sup>2</sup> Wilrich, C., and P.-Th. Wilrich: Estimation of the POD function and the LOD of a qualitative microbiological measurement method. AOAC International **92** (2009) 1763 - 1772.

### 3.1.3 Inclusivity / exclusivity

The inclusivity is the ability of the alternative method to detect the target analyte from a wide range of strains. The exclusivity is the lack of interference from a relevant range of non-target strains of the alternative method.

#### 3.1.3.1 Test protocols

##### > Inclusivity

50 *Listeria monocytogenes* strains and 30 strains belonging to *Listeria* genus (different from *Listeria monocytogenes*) were tested.

The strains were grown in nutrient broth for 24 h at 30°C and inoculated in Half Fraser broth between 1 – 100 CFU/225 ml incubated at 30°C before streaking onto RAPID'L.*mono* plates.

##### > Exclusivity

The results obtained in 1997, 1998, 1999 and 2002 with the strains not belonging to *Listeria* genus were kept.

The strains were grown in nutrient broth for 24 h at 30°C and diluted in nutrient broth. The broths were then inoculated around  $10^5$  cells/225 ml before streaking onto RAPID'L.*mono* plates.

#### 3.1.3.2 Results

Raw data are given in **Appendix 9**.

##### > Inclusivity

The 50 *Listeria monocytogenes* strains and the 30 *Listeria* spp. strains gave typical colonies on RAPID'L.*mono* plates.

##### > Exclusivity (*Listeria monocytogenes* detection)

The 22 *Listeria* spp. strain (different from *Listeria monocytogenes*) and the 43 non-*Listeria* showed non-typical colonies or no growth on RAPID'L.*mono* Agar plates.

### 3.1.4 Extension for confirmation protocols

#### 3.1.4.1 Extension for Rhamnose test for *Listeria monocytogenes* confirmation

An extension study was performed in 2008 for the use of the Rhamnose test to confirm the *Listeria monocytogenes* typical colonies isolated on the RAPID'L.*mono* plates.

150 strains of *Listeria monocytogenes* were isolated onto RAPID'L.*mono*, TSA or blood agar and 105 strains not belonging to *Listeria monocytogenes* species (52 *Listeria* spp. and 53 non-*Listeria* strains). The Rhamnose test was then applied on each colony and different incubation times were tested (4, 6, 16, 24, 48, 72 h) at 37°C.

The raw data are provided in **Appendix 10**.

The 150 *Listeria monocytogenes* strains gave positive results after 16 h incubation time of the Rhamnose test for:

- 64 % of the strains isolated from RAPID'L.*mono*;
- 95 % of the strains isolated from TSA;
- 91 % of the strains isolated from blood agar.

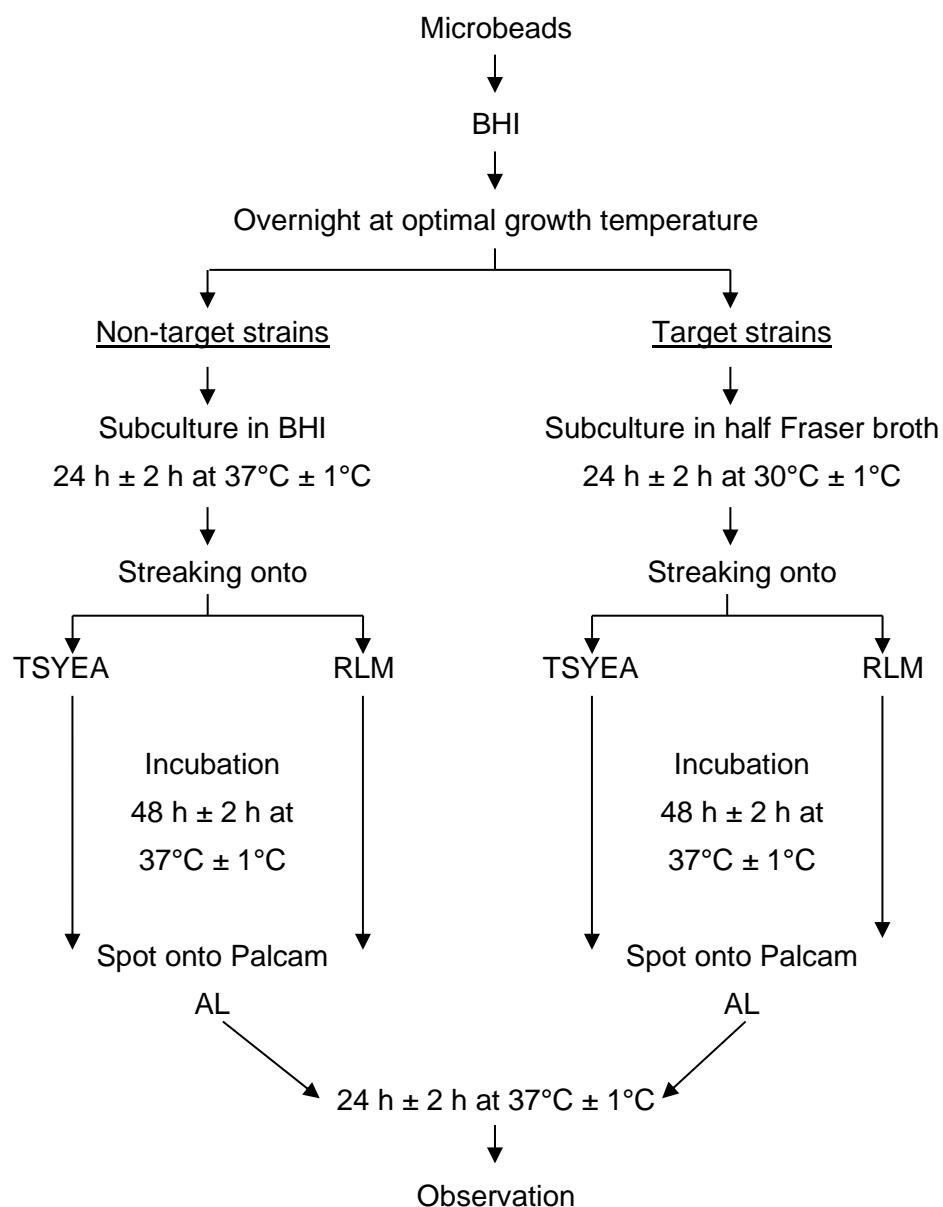

None of the 105 non-target strains tested gave typical colonies on RAPID'L.*mono* and a positive Rhamnose test.

### 3.1.4.2 Extension for confirmation of *Listeria* spp by spot onto AL or Palcam plates

> **Protocol**

150 target strains and 100 non-target strains were tested in 2019 using the protocol described in Figure 1.

**Figure 1**

## > Results

The raw data are provided in **Appendix 11**.

### - Inclusivity:

150 target strains were tested including 75 *Listeria monocytogenes* and 75 *Listeria spp* strains. They all gave typical colonies on RLM plates except *Listeria monocytogenes* Ad274 (non haemolytic strain) which shown white colonies.

For 138 strains typical grey-black spots on Palcam plates and typical blue spots on AL were observed.

For 10 *Listeria grayi* strains, atypical yellow spots were observed on Palcam plates, typical reaction was observed on AL plates .

Two *Listeria grayi* strains (Ad1307 and Ad1443) were not able to grow on Palcam plates but they gave typical blue spot on AL plate.

### - Exclusivity:

100 non target strains were tested. 28 strains were able to grow on RLM plates, 8 shown typical colonies.

2 strains gave typical reaction on AL with or without purification step on TSYEA:

- *Bacillus circulans* Ad734,
- *Enterococcus faecium* Ad180.

## > Conclusion

Despite the fact that some strains (2 among 100 tested) were able to give cross reaction on both media (RLM + AL), the specificity of the confirmation protocol using spot on AL plates is satisfying.

The confirmation protocol using the spot on Palcam gave satisfying results for inclusivity and exclusivity testing, no double cross reaction was observed (RLM+Palcam).

### 3.1.5 Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

<b>Storage conditions, shelf-life and modalities of utilisation after first use</b>	The storage temperature is $5 \pm 3^{\circ}\text{C}$ . The shelf-life is given on the package and on the plates.			
<b>Time to result</b>	Steps	Reference method	<b>Alternative method</b>	
<b>Negative samples</b>				
Sampling, enrichment	Day 0	Day 0	Day 0	Day 0
Subculture in Fraser 1	Day 1	/	/	
Streaking onto plates (O1/P1/RLSP)	Day 1	Day 1	Day 1	Day 1
Second streaking (O2/P2)	Day 3	/	/	
Reading plates (O1/P1/RLSP)	Day 2 - 3	Day 2	Day 2	Day 3
Results	Day 5	Day 2	Day 2	Day 3
<b>Presumptive positive or positive results</b>				
Subculture of typical colonies	Day 3 - 5	/	/	
Confirmation test	Day 4 - 6	Day 2	Day 2	Day 3
Results	Day 5 - 7 Day 8 - 11 *	Day 3	Day 3	Day 3
* In the case of Rhamnose and xylose tests are carried out in tubes.				
<b>Common step with the reference method</b>	Sampling enrichment			

The negative results are available in 2 days and the positive results in 3 days with the alternative method.

## 3.2 Inter-Laboratory Study

*The inter-laboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.*

### 3.2.1 Study organisation

The study was performed in 2006. Samples were sent to 15 laboratories. The study was carried out on pasteurized milk inoculated with *Listeria monocytogenes* strain isolated from raw milk cheese.

### 3.2.2 Experimental parameters controls

#### 3.2.2.1 Strain stability and background microflora stability

Strain stability was checked by inoculating the matrix at 30 CFU/25ml. Enumerations and detections were performed after 24 h and 48 h storage at  $5 \pm 3^\circ\text{C}$ . The results are given in Table 29.

Table 29 - Sample stability

Anlysis day	Reference method (detection)	Alternative method (detection)	Enumeration CFU/25 ml
Day 0	/	/	26
Day 1	+	+	22
Day 2	+	+	24

No evolution was observed during storage at  $3^\circ\text{C} \pm 2^\circ\text{C}$  for 48h

#### 3.2.2.2 Contamination levels

The contamination levels and the sample codification were the following (see Table 30).

**Table 30 - Contamination levels**

Level	Samples	Theoretical target level (b/25 ml)	True level (b/25 ml sample)	Low limit / 25 g sample	High limit / 25 g sample
Level 0	1-8-9-10-17-18-19-22	0	0	/	/
Level 1	2-6-7-11-13-14-20-23	3	2.3	1.5	3.5
Level 2	3-4-5-12-15-16-21-24	30	26.3	17.0	39

### 3.2.2.3 Logistic conditions

Temperature conditions are given in Table 31.

**Table 31 - Sample temperatures at receipt**

Collaborators	Temperature measured by the probe (°C)	Temperature measured at receipt (°C)
A	3.0	4.8
B	3.0	4.0
C	6.2	7.0
D	3.7	4.0
E	4.2	6.7
F	3.2	6.0
G	3.7	8.5
H	4.4	6.0
I	2.5	3.6
J	5.2	<b>13.9</b>
K	3.7	4.2
L	4.2	7.0
M	5.7	5.0
N	4.7	7.8
O	5.2	7.0

No problem was encountered during the transport or at receipt for the 15 collaborators. All the samples were delivered on time and in appropriate conditions even if some labs measured a temperature at receipt above 8.4°C, the probe indicated that the temperatures were all correct.

### 3.2.3 Results analysis

Raw data are provided in **Appendix 12**.

#### 3.2.3.1 Expert laboratory results

The results obtained by the expert laboratory are given in Table 32.

**Table 32 – Results obtained by the expert Lab.**

Level	Reference method	Alternative method
L0	0	0
L1	7	7
L2	8	8

#### 3.2.3.2 Results observed by the collaborative laboratories

> **Aerobic mesophilic flora enumeration**

Depending on the Lab results, the enumeration levels varied from <1 to 410 CFU/ml.

> **Listeria monocytogenes detection**

15 collaborators participated to the study. The results from Lab B were excluded for interpretation as he encountered difficulties for the confirmation step. The results obtained are provided in Table 33 (reference method) and Table 34 (alternative method).

**Table 33 - Positive results by the reference method (ALL the collaborators)**

Collaborators	Contamination level		
	L0	L1	L2
A	0	7	8
C	0	6	8
D	0	8	8
E	0	6	8
F	0	8	8
G	0	8	8
H	0	8	8
I	0	8	8
J	0	6	8
K	0	8	8

### 3.2.4 Calculation and interpretation

#### 3.2.4.1 Calculation of the specificity percentage (SP)

The percentage specificities (SP) of the reference method and of the alternative method, using the data after confirmation, based on the results of level L0 are the following (See Table 35).

**Table 35 - Percentage specificity**

<b>Specificity for the reference method</b>	$SP_{ref} = \left(1 - \left(\frac{P_0}{N_-}\right)\right) \times 100 \% =$	100 %
<b>Specificity for the alternative method</b>	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-}\right)\right) \times 100 \% =$	100 %

N: number of all L0 tests

$P_0$  = total number of false-positive results obtained with the blank samples before confirmation

$CP_0$  = total number of false-positive results obtained with the blank samples

#### 3.2.4.2 Calculation of the sensitivity ( $SE_{alt}$ ), the sensitivity for the reference method ( $SE_{ref}$ ), the relative trueness (RT) and the false positive ratio for the alternative method (FPR)

Fractional positive results were obtained for the low inoculation levels (L1). This inoculation level was retained for calculation.

A summary of the results of the collaborators retained for interpretation, and obtained with the reference and the alternative methods for Level 1 is provided in Table 36.

**Table 36 - Summary of the obtained results with the reference method and the alternative method for Level 1**

Response	Reference method positive (R+)	Reference method negative (R-)
Alternative method positive (A+)	Positive agreement (A+/R+) PA = 103	Positive deviation (R-/A+) PD = 0
Alternative method negative (A-)	Negative deviation (A-/R+) ND = 0 (PPND=0)	Negative agreement (A-/R-) NA = 9 (PPNA=0)

Based on the data summarized in Table 36, the values of sensitivity of the alternative and reference methods, as well as the relative trueness and false positive ratio for the alternative method taking account the confirmations, are the following (See Table 37).

**Table 37 - Sensitivity, relative trueness and false positive ratio percentages**

Sensitivity for the alternative method:	$SE_{alt} = \frac{(PA+PD)}{(PA+PD+ND)} \times 100\% =$	100 %
Sensitivity for the reference method:	$SE_{ref} = \frac{(PA+ND)}{(PA+PD+ND)} \times 100\% =$	100 %
Relative trueness	$RT = \frac{(PA+NA)}{N} \times 100\% =$	100 %
False positive ratio for the alternative method	$FPR = \frac{FP}{NA} \times 100\% =$	0 %

#### 3.2.4.3 Interpretation of data

For a **paired study design**, the difference between (ND – PD) and the addition (ND + PD) are calculated for the level(s) where fractional recovery is obtained (so  $L_1$  and possibly  $L_2$ ). The observed value found for (ND – PD) and (ND + PD) shall not be higher than the AL.

For 14 Labs, the limits are the following:

	Calculated values	AL	Conclusion
ND - PD	0	4	ND-PD<AL
ND + PD	0	6	ND+PD<AL

**The EN ISO 16140-2:2016 requirements are fulfilled as (ND - PD) and (ND + PD) are below the AL.**

#### 3.2.4.4 Evaluation of the LOD<sub>50%</sub>, LOD<sub>95%</sub> and RLOD between laboratories

The LOD<sub>50%</sub>, the LOD<sub>95%</sub> and the RLOD was calculated using the EN ISO 16140-2:2016 Excel spreadsheet available at [https://standards.iso.org/iso/16140/-5/ed-1/en/RLOD\\_inter-lab-study\\_16140-2\\_AnnexF\\_ver1\\_28-06-2017.xls](https://standards.iso.org/iso/16140/-5/ed-1/en/RLOD_inter-lab-study_16140-2_AnnexF_ver1_28-06-2017.xls). The results are used only for information (see Table 38).

**Table 38 - LOD<sub>50%</sub>, LOD<sub>95%</sub> and RLOD**

Method	LOD 50%	LOD 95%	RLOD
Reference	0.63 [0.49;0.81]	2.73 [2.12;3.52]	
Alternative	0.63 [0.49;0.81]	2.73 [2.12;3.52]	1.00 [0.74;1.34]

### 3.3 General conclusion

The **method comparison study conclusions** are:

The method comparison study scheme corresponds to a PAIRED STUDY design as the alternative and reference methods have a common enrichment procedure.

#### ➤ *Listeria spp detection*

In the sensitivity study, six categories were tested: five food categories and the production environmental samples. The protocol of the alternative method shows 4 positive deviations (PD) and 4 negative deviations (ND) for the over all categories for 48 h incubation time. The observed values for ND+PPND-PD and for ND+PPND+PD meet the acceptability limit (AL) for each individual category and for all the categories combined.

The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 1.5 for paired studies, for all matrix/strain pairs tested.

The RAPID'*L.mono* method is specific and selective.

It is possible to store the Half-Fraser broths and the plates for 72 h at  $5 \pm 3^\circ\text{C}$ .

The negative results are available in 2 days and the positive results in 3 days with the alternative method.

The alternative method fulfils all the EN ISO 16140-2:2016 and AFNOR technical rules (revision 6).

#### ➤ *Listeria monocytogenes detection*

In the sensitivity study, six categories were tested: five food categories and the production environmental samples. The protocol of the alternative method shows 4 positive deviations (PD) and 4 negative deviations (ND) for 22h incubation time, 5 positive deviations (PD) and 3 negative deviations (ND) for 48h incubation time for the over all categories. The observed values for ND+PPND-PD and for ND+PPND+PD meet the acceptability limit (AL) for each individual category and for all the categories combined.

The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 1.5 for paired studies, for all matrix/strain pairs tested.

The RAPID'L.*mono* method is specific and selective

It is possible to store the Half-Fraser broths and the plates for 72 h at 5 ± 3°C.

The negative results are available in 2 days and the positive results in 3 days with the alternative method.

The alternative method fulfils all the EN ISO 16140-2:2016 and AFNOR technical rules (revision 6).

The **inter-laboratory study conclusions** are:

The data and interpretations comply with the EN ISO 16140-2:2016 requirements.

**The RAPID'L.*mono* method is considered equivalent to the ISO standard.**

Quimper, 26 June 2023

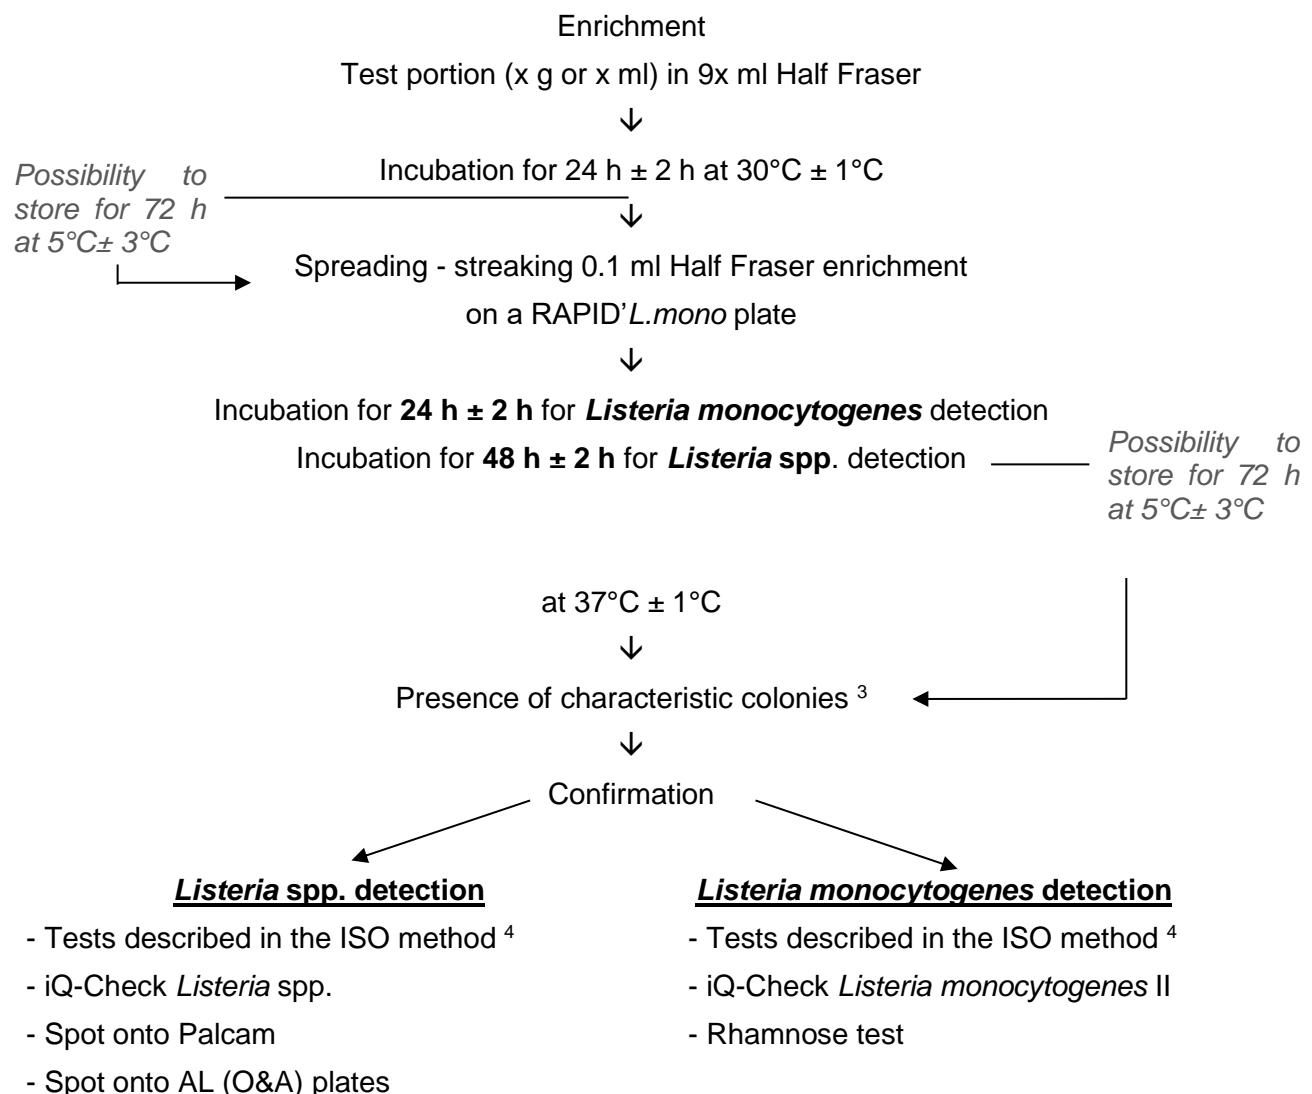

Maryse RANNOU

Project Manager

Validation of Alternative methods

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

Appendix 1 – Flow diagram of the alternative method: RAPID'L.*mono*

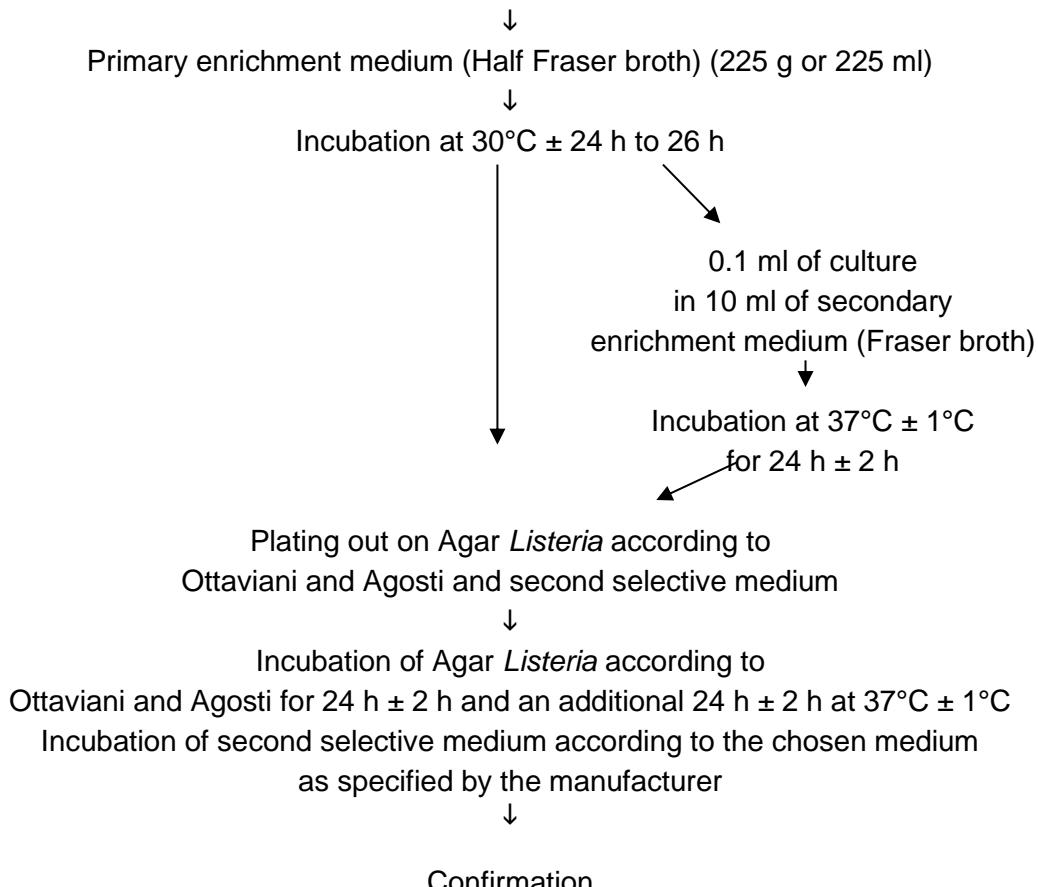

<sup>3</sup> Characteristic colonies of *Listeria monocytogenes* (blue) or of *Listeria ivanovii* (blue with yellow halo) or of *Listeria* other than *monocytogenes* (white or light yellow)

<sup>4</sup> Tested during the validation study

**Appendix 2 – Flow diagram of the reference method: ISO 11290-1 (2017):**  
**Microbiology of the food chain - Horizontal method for the detection and enumeration**  
**of *Listeria monocytogenes* and of *Listeria* spp. -**

**Part 1: detection method**

Test portion (25 g or 25 ml)  
 1 swab + 10 ml Half Fraser broth<sup>5</sup>  
 1 sponge + 100 ml Half Fraser broth  
 1 wipe + 225 ml Half Fraser broth

Target	Gram	Catalase	Beta hemolysis	CAMP test	Carbohydrates
<i>Listeria</i> spp	x	x			
<i>Listeria monocytogenes</i>	x	Optional	x	Optional	x

<sup>5</sup> For sampling after cleaning process pre-moisten  
 - 1 swab + 1 ml broth universal neutralizing (+ 9 ml Half-Fraser)  
 - 1 sponge + 10 ml broth universal neutralizing (+ 90 ml Half-Fraser)  
 - 1 wipe + BPW + 10 % neutralizing agent (+ 225 ml Half-Fraser)

Appendix 3 – Artificial contamination of samples – (IPL, 2006 – in French): *Listeria* spp. and *Listeria monocytogenes*

## Appendix 5 – Sensitivity study: raw data – RAPID'L.*mono* for *Listeria* spp. detection

### IPL – Legend

#### **Total bacteria growth**

Ø : no growth  
L = low  
M = medium  
H = high

#### **Distribution of flora**

A = pure culture of suspicious colonies (blue)  
B = mix with a majority of suspicious colonies  
C = mix with a minority of suspicious colonies  
D = mix with rare suspicious colonies  
E = absence of suspicious colonies  
(x) : x typical colonies of *Listeria* if  $x \leq 5$

(48h) : result after 48 hours incubation of agars  
sh = without halo

(b) : Bacillus  
(st) : staphylocoque  
j : yellow  
blc : white

CA : artificial contamination  
*Mixt* : contamination by mixture  
P or PAL : Palcam agar  
AL : *Listeria* agar according to Ottaviani and Agosti  
RLM : Rapid'L.*mono* agar

### ADRIA – Legend

#### **Bold typing : artificially inoculated samples**

#### ***Listeria* detection results:**

H-: characteristic *Listeria* colonies without halo  
H+: characteristic *Listeria* colonies with halo  
-: no typical colonies but presence of background microflora  
st: plate without any colony  
i: PCR inhibition  
PA: positive agreement  
NA: negative agreement  
ND: negative deviation  
PD: positive deviation  
PPNA: positive presumptive negative agreement  
PPND: positive presumptive negative deviation  
NC: non-characteristic colony on TSYEA  
d: doubtful colony  
F1: Fraser 1

Analyses performed according to the COFRAC accreditation

**IPL – Legend**

- +: positive result
- : negative result
- /: test not realized
- $\emptyset$ : absence of colonies
- $\emptyset$ , L, M, H : level of bacterial load from absence to high
- A: pure culture of suspected colonies
- B: mixing with a majority of suspected colonies
- C: mixing with a minority of suspected colonies
- D: mixing with rare suspected colonies
- E: absence of suspected colonies
