## 1 INTRODUCTION

---

The iQ-Check *Listeria monocytogenes* method was validated in April 2005 according to the ISO 16140:2003 (certificate number BRD 07/10 - 04/05). The study was performed by IPL. The following renewals and extensions were performed:

Date	Validation	Reference method	Validation standard	Expert laboratory
April 2005	Initial validation	ISO 11290-1 (1997)	ISO 16140 (2003)	IPL
December 2006	Extension for a new protocol (enrichment in LSB broth) and a new DNA extraction protocol (Easy II protocol)	ISO 11290-1 (1997) ISO 11290-1/A1 (2005)	ISO 16140 (2003)	IPL
September 2007	Extension for the use of new thermal cyclers: MiniOpticon and iQ5	/	/	Bio-Rad internal data*
January 2009	Extension for the use of a new mix PCR and a new version of the Opticon Monitor software including automatic analysis	/	/	Bio-Rad internal data*
March 2009	Renewal study	ISO 11290-1 (1997) ISO 11290-1/A1 (2005)	ISO 16140 (2003)	IPL
February 2010	Extension with: <ul style="list-style-type: none"> <li>▪ Modification of the extraction step with the utilization of a new consumable (Deep Well plate) in addition to the tube format previously validated</li> <li>▪ Use of the CFX Manager software to handle the CFX96 and MiniOpticon real-time PCR thermocyclers</li> </ul>	ISO 11290-1 (1997) ISO 11290-1/A1 (2005)	ISO 16140 (2003)	Bio-Rad internal data*
February 2012	Extension concerning the use of the CFX96 Touch Deep Well thermocycler and the CFX Manager software IDE version 1.2	/	/	Bio-Rad internal data*
March 2013	Renewal study	ISO 11290-1 (1997) ISO 11290-1/A1 (2005)	ISO 16140 (2003)	ISHA

	Extension to the use of the iQ-Check Prep automation system v1 and the CFX Manager software IDE v2.0	ISO 11290-1 (1997) ISO 11290-1/A1 (2005)	ISO 16140 (2003)	Bio-Rad internal data*
October 2013	Extension to the CFX Manager Software IDE v2.1	/	/	Bio-Rad internal data*
November 2014	Extension to the iQ-Check Prep v2 and CFX Manager Software IDE v2.2	/	/	Bio-Rad internal data*
January 2018	Renewal study according to the ISO 16140-2:2016	ISO 11290-1 (2017)	ISO 16140-2 (2016)	ADRIA
May 2018	Extension to the iQ-Check Prep v3 and CFX Manager Software IDE v3.0	/	/	Bio-Rad internal data*
January 2020	Extension for the production environmental samples category <ul style="list-style-type: none"> <li>▪ For a new enrichment protocol associated with the Easy II lysis protocol</li> <li>▪ For the use of the iQ-Check Free DNA Removal Solution (FDRS) protocol associated with the Easy II lysis protocol</li> <li>▪ For the use of a new Application Protocol File (APF Fast).</li> </ul>	ISO 11290-1 (2017)	ISO 16140-2 (2016)	ADRIA
February 2021	Renewal study	ISO 11290-1 (2017)	ISO 16140-2 (2016)	ADRIA
April 2021	Extension for the use of the APF fast for all the categories and protocols	/	/	Bio-Rad internal data*
May 2021	Extension for the use of the iQ-Check Prep v4	/	/	Bio-Rad internal data*
December 2022	Extension for the use of the CFX Opus Deep Well and CFX Manager Software IDE v3.1	/	ISO 16140-2 (2016)	Bio-Rad internal data*
June 2023	Extension study for the use of LSB II medium on composite foods and production environmental samples	ISO 11290-1 (2017)	ISO 16140-2 (2016)	ADRIA
October 2023	Extension study for the use of LSB II medium on Dairy products	ISO 11290-1 (2017)	ISO 16140-2 (2016)	ADRIA

\* Manufacturer internal data are not included in this report

## 2 METHOD PROTOCOLS

---

### 2.1 Alternative method

The flow diagrams of the alternative method are provided in **Appendix 1**.

#### 2.1.1 Principle

The iQ-Check *Listeria monocytogenes* II kits are tests based on gene amplification and detection by real-time PCR. Ready-to-use PCR reagents contain oligonucleotides (primers and probes) specific for *Listeria monocytogenes*, as well as DNA polymerase and nucleotides. Detection and data analysis are optimized for use with a Bio-Rad real-time PCR instrument, such as the CFX96™ Touch standard or Deep Well (DW) or CFX Opus Deep Well (DW) systems.

PCR is a powerful technique used to generate many copies of target DNA. During the PCR reaction, several cycles of heating and cooling allow DNA denaturation, by heat, followed by primers binding to the target region. The DNA polymerase then uses these primers and deoxynucleotide triphosphates (dNTPs) to extend the DNA, creating copies of the target DNA. These copies are called amplicons.

This test allows the detection of *Listeria monocytogenes* in environmental samples and food products previously enriched by culture in Half Fraser broth or *Listeria* Special Broth (LSB or LSB II). It includes the following 4 main steps:

- Enrichment,
- DNA extraction,
- Real-time PCR,
- Data analysis & interpretation.

The FDRS protocol (Free DNA Removal Solution) can be applied to remove free DNA from food and environmental samples prior to PCR analysis. In the context of validation, this protocol concerns the environmental samples. It is performed by a selected enzyme and its specific buffer under optimized conditions. The iQ-Check lysis buffer associated with thermal lysis inactivates the enzyme, allowing extraction from intact and living cells.

The PCR can be performed using either the classical iQ-Check APF (Application Protocol File) which corresponds to a 1h50 min PCR run or the APF Fast (reduction of the number of cycles + time reduction of some steps) to reduce the PCR run time down to 1h10 min.

## 2.1.2 Protocol

The different protocols and steps are described below:

Enrichment step	<p>Protocols available:</p> <ul style="list-style-type: none"> <li>- <b>Half Fraser</b> for <b>24 - 26 h at 30°C</b> for all categories (Protocol 1)</li> <li>- <b>LSB</b> broth for <b>22 - 24 h at 30°C ± 1°C</b> for all categories (Protocol 2)</li> <li>- <b>LSB</b> broth for <b>24 - 26 h at 30°C ± 1°C</b> for all categories (Protocol 3).</li> <li>- <b>LSB</b> broth for <b>18 - 26 h at 30°C ± 1°C</b> for environmental samples (Protocols 4 and 5)</li> <li>- <b>LSB II</b> broth for <b>18 - 26 h at 37°C ± 1°C</b> for composite foods and environmental samples (Protocol 6)</li> <li>- <b>LSB II</b> broth for <b>20 - 28 h at 37°C ± 1°C</b> after pre-warming of the broth (Protocol 7)</li> </ul>
<b>iQ-Check Free DNA Removal Solution (FDRS): (Protocol 5: optional for environmental samples)</b>	<ul style="list-style-type: none"> <li>- Activate the iQ-Check Free DNA Removal Solution (FDRS)</li> <li>- Pipette 10 µl of activate reagent into the bottom of each well of a 96-Deep Well microplate</li> <li>- Add 100 µl of decanted enriched LSB or LSB II per well. Seal the Deep Well microplate with the X-Pierce sealing film</li> <li>- Incubate in the thermoshaker without shaking for 15 to 30 min at 37°C</li> <li>- Proceed to Easy II DNA extraction protocol using 100 µl of treated enriched sample</li> </ul>
Lysis step	<ul style="list-style-type: none"> <li>- <b><u>Standard II protocol (protocols 1 and 2):</u></b> <ul style="list-style-type: none"> <li>▪ Centrifugation of 1.5 ml enriched Half-Fraser or LSB broth at 10000 - 12000 g for 5 min</li> <li>▪ Discard the supernatant</li> <li>▪ Addition of 250 µl of lysis reagent (A: lysis reagent + F: lysis beads)</li> <li>▪ Resuspend pellet by pipetting the reagent up and down in the tube</li> <li>▪ Agitation using the "Disruptor Genie" for 3 min ± 1 min</li> <li>▪ Incubation at 95 - 100°C for 15 - 20 min</li> <li>▪ Vortex at high speed</li> <li>▪ Centrifugation at 10000 - 12000 g for 5 min.</li> </ul> </li> </ul>

	<ul style="list-style-type: none"> <li>- <b><u>Easy II protocol (protocol 3 to 7)</u></b> <ul style="list-style-type: none"> <li>▪ Aliquote 100 µl of lysis reagent (A + F) to tubes of wells of Deep Well plate</li> <li>▪ Add 100 µl of enriched LSB or LSB II broth</li> <li>▪ Place tubes in the cell disruptor for 3 min ± 1 min (for tubes only)</li> <li>▪ Incubation at 95 - 100°C for 15 - 20 min in a heat block (tubes) or in the plate agitator-incubator (Deep Well plates) under agitation at 1300 rpm</li> <li>▪ Centrifugation at 10000 - 12000 g for 2 min (tubes only).</li> </ul> </li> </ul>
PCR	<ul style="list-style-type: none"> <li>- Add 5 µl of lysates supernatant to 45 µl of PCR mix (reagent B + reagent C)</li> <li>- Run PCR;</li> <li>- In case of inhibition, a 1/10 dilution is applied to the DNA extract.</li> </ul>
Confirmation	<p>The positive PCR tests are confirmed by:</p> <ul style="list-style-type: none"> <li>- Reference method: streaking 10 µl of the enriched broth (Half Fraser or LSB or LSBII) onto O&amp;A or Palcam plates incubated for 24 to 48 h at 37°C ± 1°C. The typical colonies are confirmed by the tests described in the ISO method.</li> <li>- Alternative method: streaking 100 µl of enriched broth (Half Fraser or LSB) onto Agar <i>Listeria</i> or RAPID'<i>Listeria</i> Agar or RAPID'<i>L.mono</i> Agar incubated for 24 h at 37°C ± 1°C. For RAPID'<i>L.mono</i> and Agar <i>Listeria</i>, the only presence of typical colonies allows to confirm the positive PCR result. For RAPID'<i>Listeria</i> spp confirmation, the typical colonies are confirmed by the tests described in the ISO method.</li> <li>- By any other method certified by NF Validation based on a principle different from that used in the iQ-Check method starting from the same enrichment step.</li> </ul>

It is possible to store the enrichment broths for 72 h at 5°C ± 3°C before proceeding to PCR and confirmatory tests.

The protocols tested during the different validation studies are summarized in Table 1.

**Table 1 – Summary of the protocols**

Validation study	Protocol	Scope	Enrichment step	FDRS	Lysis step	APP <sup>1</sup>
Initial 2005	Protocol 1	All categories	Half Fraser for 24h – 26 h at 30°C ±1°C	No	Standard II	Classic Fast
	Protocol 2		LSB for 22 – 24 h at 30°C ±1°C	No	Standard II	Classic Fast
Extension 2006	Protocol 3	Environmental samples	LSB for 24h – 26 h at 30°C ±1°C	No	Easy II	Classic Fast
	Protocol 4		LSB for 18 -26 h at 30°C ±1°C	No	Easy II	Classic Fast
Extension 2020	Protocol 5	Environmental samples	LSB for 18 – 26 h at 30°C ±1°C	Yes	Easy II	Classic Fast
	Protocol 6	Composite foods Environmental samples	LSB II for 18 - 26 h at 37°C ± 1°C	Optional	Easy II	Fast
Extension 2023	Protocol 7	Dairy products	Pre-warmed LSB II broth for 20 - 28 h at 37°C ± 1°C	Optional	Easy II	Fast

### 2.1.3 Restrictions

There is no restriction for use.

## 2.2 Reference method♦

The reference method is the ISO 11290-1 (May 2017): Microbiology of the food chain - Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria* spp. - Part 1: detection method.

The flow diagram is given in **Appendix 2**.

## 2.3 Study design

It was an **unpaired study**, except for Protocol 1 (Half-Fraser) which has the same enrichment protocol as the reference method.

---

<sup>1</sup> Application Protocol File

♦ Analysis performed according to the COFRAC accreditation

### 3 METHOD COMPARISON STUDY

---

**The method comparison study is a study performed by the expert laboratory to compare the alternative method with the reference method.**

*The study was carried out on a diversity of samples and strains representative of agri-food products. This does not constitute an exhaustive list of the different matrices included in the scope.*

*For any comment on the alternative method, please contact AFNOR Certification at <http://nf-validation.afnor.org/contact-2/>.*

#### 3.1 Initial validation, extension/renewal studies: results – Half-Fraser and LSB protocol

As different protocols are available for samples testing, the following combinations of protocols were used for interpretation of the data generated during the different studies (See **Table 2**).

**Table 2 – Combinations of protocols used for interpretation**

Interpretation	Food categories (categories 1 to 5)	Environmental samples category (category 6)
A1	Protocol 1	Protocol 1
B1	Protocol 1	Protocol 4 – APF Classic
C1	Protocol 1	Protocol 5 – APF Classic
D1	Protocol 1	Protocol 4 – APF Fast
E1	Protocol 1	Protocol 5 – APF Fast
A2	Protocol 2	Protocol 2
B2	Protocol 2	Protocol 4 – APF Classic
C2	Protocol 2	Protocol 5 – APF Classic
D2	Protocol 2	Protocol 4 – APF Fast
E2	Protocol 2	Protocol 5 – APF Fast
A3	Protocol 3	Protocol 3
B3	Protocol 3	Protocol 4 – APF Classic
C3	Protocol 3	Protocol 5 – APF Classic
D3	Protocol 3	Protocol 4 – APF Fast
E3	Protocol 3	Protocol 5 – APF Fast

##### 3.1.1 Sensitivity study

*The sensitivity (SE) is the ability of the method to detect the analyte by either the reference or alternative method.*

### 3.1.1.1 Number and nature of samples

The distribution per type is given in **Tables 3 to 5**.

**Table 3 – Distribution per type - Results associated to Protocol 1**

Category		Type		Protocol	APF	Positive	Negative	Total					
1	Meat products	a	Raw products (including deep-frozen, fresh, seasoned)	Protocol 1	Classic	10	20	30					
		b	RTE and processed meat products	Protocol 1	Classic	7	15	22					
		c	Fermented or dried meats products (raw and cooked)	Protocol 1	Classic	14	10	24

### 3.1.1.2 Artificial contamination of samples

Artificial contaminations were done by seeding or spiking protocol. The artificial contaminations are presented in **Appendix 3**.

115 samples were artificially contaminated for studies performed in 2005, 2006 and 2017.

For the extension performed in 2019, 31 samples were artificially contaminated. 29 gave a positive result by both protocols (with or without FDRS).

The repartition of the positive samples per inoculation protocol and inoculation level is given in:

- **Table 6** for Protocol 1 combined with the extension,
- **Table 7** for Protocol 2 combined with the extension,
- **Table 8** for Protocol 3 combined with the extension.

**Table 6 - Repartition of the positive samples  
per inoculation protocol and inoculation level –  
Results associated to Protocol 1**

Validation study	Category	Number and percentage of samples analyzed per contamination level (CFU/sample)				
		Naturally contaminated	≤5 (spiking) ≤3 (seeding)	5-10 (spiking) 3-10 (seeding)	10<x<30	Total
Initial, extension and renewal studies	Meat products	30	0	1	0	31

%		51.4 %	37.8 %	8.0 %	2.8 %	100.0 %

**The percentage of samples inoculated between 3 (spiking) or 5 (seeding) and 10 CFU is comprised between 4.3 and 8.0 % depending on the protocols used for analysis.**

**The percentage of naturally contaminated samples varies from 51.4 % to 53.6 % depending on the combination of protocols used.**

### 3.1.1.3 Protocols applied during the validation study

#### > Enrichment, lysis and PCR protocols

The minimum incubation time was evaluated for all studies.

A summary of the protocols evaluated during the initial validation study and the extensions in 2006 and 2020 is shown in Table 9.

**Table 9 – Summary of protocols tested**

Validation study	Protocol	Scope	Enrichment step	FDRS	Lysis step	APP <sup>2</sup>
Initial 2005	Protocol 1	All categories	Half Fraser for 24 h at 30°C ±1°C	No	Standard II	Classic
Extension 2006	Protocol 2		LSB for 22 h at 30°C ±1°C	No	Standard II	Classic
	Protocol 3		LSB for 24 h at 30°C ±1°C	No	Easy II	Classic
Extension 2020	Protocol 4	Environmental samples	LSB for 18 h at 30°C ±1°C	No	Easy II	Classic
	Protocol 5		LSB for 18 h at 30°C ±1°C	Yes	Easy II	Fast

An incubation time of 15 min in the thermoshaker was applied for the validation study.

#### > Confirmation protocol

During the validation studies, the following protocols were tested:

- Tests described in the ISO method (streaking 10 µl onto AL and Palcam);
- Streaking 100 µl of enriched sample (Half-Fraser broth or LSB broth) onto RAPID'L. mono Agar. The presence of typical colonies allows to confirm the positive PCR test but during the validation study, the typical colonies were confirmed by the tests described in the ISO method.

For the extension study performed in 2020, for negative PCR samples, the enriched LSB broth was sub-cultured in Fraser broth for 24 h ± 2 h at 37°C ± 1°C in order to have the total duration of time equivalent to the ISO method before streaking onto O&A and Palcam plates (ISO 16140-2 requirements).

<sup>2</sup> Application Protocol File

> ***Enrichment broth storage***

The enriched LSB broths from positive and discordant samples were tested again after storage for 72 h at 5°C ± 3°C. DNA extractions, PCR tests and confirmatory tests were run again. This concerns Protocols 2, 3, 4 and 5.

### 3.1.1.4 Test results

Raw data are given in **Appendix 4**. The results are given in **Tables 10 to 12**.

**Table 10 – Interpretation of sample results between the reference and alternative method (based on the confirmed alternative method results)**

\* PPNA not included

\*\* PPND not included

The two APF (Fast and Classic) have been tested for both extraction protocols (with or without FRDS). One positive presumptive not confirmed samples (PPN) were observed when applying the APF Classic with adding the FDRS step, and 2 without FDRS. When the APF Fast was applied, no PPN sample was observed whatever the extraction protocol used (with or without FDRS step).

With  $ND = ND + PPND$  $NA = NA + PPNA$

### 3.1.1.6 Analysis of discordant results

The negative deviations observed for this extension study are given in **Table 19** and the positive deviations in **Table 20**.

#### > Negative deviations

- Protocol 1:

Six negative deviations were observed for the categories tested with protocol 1. For these samples the confirmatory tests of the alternative method concluded to the presence of *Listeria monocytogenes* in the enrichment broth. The detection level of the alternative method was probably not reached in the enrichment broths.

- Protocol 2:

For the categories tested using protocol 2, 11 negative deviations were observed, the presence of *Listeria monocytogenes* was not confirmed in the enrichment broth for 9 samples. The discordant results for these samples could be due to the unpaired study design and the heterogeneity of sampling.

For five samples the confirmatory tests concluded to the presence of *Listeria monocytogenes* in the enrichment broths. The PCR tests were applied twice, and the second PCR test gave a positive result, the contamination level was probably just at the detection limit of the iQ-Check method.

- Protocol 3:

15 negative deviations were observed for the categories tested with protocol 3. For 9 samples, the presence of *Listeria monocytogenes* was not confirmed in the enrichment broth. This could be due to the unpaired study design.

For 6 samples, the presence of *Listeria monocytogenes* was confirmed in the enrichment broth, the detection limit of the alternative method was probably not reached in these cases.

- Protocols 4 and 5:

For environmental samples tested for the extension study performed in 2019, seven negative deviations were observed without using the FDRS protocol (Protocol 4) and six using the FDRS (Protocol 5). Sample 5084 was tested twice, and 2 PCR results were observed for Protocol 4 (APF Classic). The contamination level was probably just at the limit of detection of the method. Note that the

presence of *Listeria monocytogenes* was confirmed in the enrichment broth for this sample.

For sample 5085, a positive PCR result with a late Ct value (40.02) was obtained with Protocol 4 (APF Classic) but it was impossible to confirm the presence of *Listeria monocytogenes* in the enrichment broth for this sample.

#### ➤ **Positive deviations**

- Protocol 1:

One positive deviation was observed for a naturally contaminated sample.

- Protocol 2:

Twenty-one positive deviations were observed, they concern 2 artificially contaminated samples and 19 naturally contaminated samples.

- Protocol 3:

Twenty positive deviations were observed, they concern 2 artificially contaminated samples and 18 naturally contaminated samples.

- Protocols 4 and 5:

Eight positive deviations were observed whatever the extraction protocol (with or without FDRS) or APF file applied.; all concern naturally contaminated samples.

As requested in the ISO 16140-2 (2016), the samples in negative agreement were tested using the same incubation time as the reference method (subculture of LSB in Fraser broth for 24 h at 37°C before streaking onto selective agar plates); all the results were negative.

\* PPND not included

The observed values for ND - PD and ND + PD meet the acceptability limit for each individual category and for all the combined categories (calculated values  $\leq$  AL) for all the protocols tested.

### 3.1.1.8 Confirmation

Four selective agar plates were tested for the extension study: AL, Palcam, RAPID'L.*mono* and RAPID'*Listeria* spp. When the presence of *Listeria monocytogenes* was confirmed in the enrichment broth, typical colonies were present on the four plates except in one case: for sample 5579, no typical colony was observed on RAPID.

It was impossible to confirm the presence of *Listeria monocytogenes* in the enrichment broth after incubation time for two samples (5079, 5085) and for 3 samples after enrichment broth storage (4052, 4060, 5078) even if 5 Fraser broths, 5 AL and 5 Palcam were tested.

### 3.1.1.9 PCR inhibition

For protocol 1, 425 DNA extracts were tested, two inhibitions were observed, they are listed in **Table 27**.

**Table 27 - PCR inhibitions and invalid results (Protocol 1)**

For protocols 4 and 5, no inhibition was observed among the 424 lysates tested.

### 3.1.2 Relative level of detection

The relative level of detection is the level of detection at  $P = 0.50$  ( $LOD_{50}$ ) of the alternative (proprietary) method divided by the level of detection at  $P = 0.50$  ( $LOD_{50}$ ) of the reference method.

The RLOD is defined as the ratio of the alternative and reference methods:

$$RLOD = \frac{LOD_{Alt.}}{LOD_{Ref.}}$$

The relative detection level is the smallest number of culturable micro-organisms that can be detected in the sample in 50% of occasions by the alternative and reference methods.

#### 3.1.2.1 Experimental design

Seven (matrix/strain) pair were analyzed by the reference method and by the alternative method (See **Table 30**).

**Table 30 - Defined matrix/strain pair for the RLOD determination**

Category	Type	Strain	Origin	Inoculation protocol prior analysis	Analysis protocol
Meat products	Ground beef (15 % of fat)	<i>Listeria monocytogenes</i> 1/2a LIS.4.26	Ham	/	P1 P2 P3
Dairy products	Raw milk	<i>Listeria monocytogenes</i> 1/2b LIS.4.32	Raw milk	/	
Sea food products	Cod filet	<i>Listeria monocytogenes</i> 1/2a LIS.4.32	Fish with lemon sauce and rice	/	
Vegetable products	Salad	<i>Listeria monocytogenes</i> 1/2c LIS.4.35	Chef sandwich salad	/	
RTE-RTRH	Pasta salad	<i>Listeria monocytogenes</i> 3a LIS.4.29	Goat cheese sandwich	/	
Environmental samples	Process water	<i>Listeria monocytogenes</i> 4b LIS.4.30	Surface control on salmon	/	
Environmental samples	Process water	<i>Listeria monocytogenes</i> Ad2503	Vegetable industry	Seeding for 48 h at 3°C ± 2°C	P4 P5

The following protocol was applied:

- A negative control: 5 samples,
- A low contamination level providing fractional recovery data, with 20 replicates,
- A high contamination level, with 5 replicates.

A total plate count determination on the matrix was performed to estimate the total microbial load on the day of analysis.

The analyses were performed with and without applying the FDRS protocol and with the two APF (Classic and Fast) for the process water tested in 2019.

### 3.1.2.2 Calculation and interpretation of the RLOD

The raw data are given in **Appendix 5**.

The RLOD calculations were performed using the Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 15.08.2015. The RLOD are given **Tables 31 to 34**.

**Table 31 – Presentation of RLOD before and after confirmation of the alternative method results (Protocol 1)**

### 3.1.2.3 Conclusion

**The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 2.5 for unpaired studies, for the matrix/strain pairs tested with all the protocols.**

### 3.1.3 Inclusivity / exclusivity

The inclusivity is the ability of the alternative method to detect the target analyte from a wide range of strains. The exclusivity is the lack of interference from a relevant range of non-target strains of the alternative method.

#### 3.1.3.1 Test protocols

##### > Inclusivity

For the initial validation study performed in 2005, 50 *Listeria monocytogenes* strains were tested using the protocol 1: inoculation between 10 to 100 CFU/225 ml Half Fraser broth and incubation for 24 h at 30°C. The standard II extraction protocol was applied before performing the PCR test.

In 2019, for the extension study, 50 additional *Listeria monocytogenes* strains were tested. They were inoculated between 10 to 100 CFU/225 ml LSB broth incubated for 18 h at 30°C before applying the iQ-Check protocol including the FDRS step (Protocol 5).

<sup>4</sup> Wilrich, C., and P.-Th. Wilrich: Estimation of the POD function and the LOD of a qualitative microbiological measurement method. AOAC International **92** (2009) 1763 - 1772.

### > Exclusivity

33 non-target strains were tested in 2005 (16 *Listeria* spp strains different from *Listeria monocytogenes*, and 17 strains not belonging to *Listeria* genus); they were grown in nutrient broth and then inoculated at  $10^5$  CFU/ml nutrient broth for the non-*Listeria* strains, inoculated at 10 - 100 CFU/225 ml Half Fraser for the *Listeria* spp. strains. The Standard II extraction protocol and the PCR assay were then carried out on the broths incubated for 24 h  $\pm$  2 h at 30°C  $\pm$  1°C.

In 2006, 39 non-target strains were tested (22 non-*Listeria monocytogenes* and 17 non-*Listeria* strains). They were inoculated at  $10^5$  CFU/ml nutrient broth for 24 h at 30°C. The Easy II extraction protocol and the iQ-Check *Listeria monocytogenes* II were performed.

#### 3.1.3.2 Results

### > Inclusivity

The 50 *Listeria monocytogenes* strains tested with the protocol 1 gave positive PCR results with the iQ-Check *Listeria monocytogenes* II.

For the extension study, the 50 additional target strains tested with the protocol 5 also gave positive PCR results. All the strains gave typical colonies on AL (Agar Listeria) and Palcam plates. Raw data are given in **Appendix 6**.

One strain (*Listeria monocytogenes* Ad274) gave atypical white colonies on RAPID'L.*mono*. Two strains gave typical colonies on RAPID'L*Listeria* spp. only after 48 h incubation time of the plates.

### > Exclusivity

The 69 non-target strains tested gave negative PCR tests.

A non-repeatable cross-reaction was observed in the initial validation study (2005) with *Enterococcus faecium* grown in nutrient broth but when the strain was grown in Half Fraser broth a negative PCR result was obtained. The same strain was retested in the extension study (2006), with the Easy II lysis protocol, from a nutrient broth and the result was also negative.

### 3.1.4 Practicability

The practicability of the alternative method was informed according to the criteria defined by the Technical Committee.

#### Time to results:

Positive results are obtained in 2 to 7 days (depending on the method of confirmation) with the alternative method against 4 to 7 days with the reference method.

The negative results are obtained in 1 day with the alternative method for 2 to 5 days with the reference method.

In the case of presumed positive results by the alternative method, but negative after confirmation, the negative results are obtained in 2 to 4 days depending on the method of confirmation used.

## 3.2 Extension study for the use of LSB II medium

### 3.2.1 Sensitivity

#### 3.2.1.1 Number and nature of samples

Combining the three categories tested with LSBII broth, 210 samples were tested providing 93 positive and 117 negative results.

The distribution per tested category and type is given in Table 39.

**Table 39 – Distribution per tested category and type**

Category		Type		Positive samples	Negative samples	Total
1	Composite foods	a	Ready-to-eat	8	14	22
		b	Ready-to-reheat	13	18	31
		c	Confectionaries, pastries and egg products	10	13	23
		Total		31	45	76
2	Production environmental samples	a	Surfaces samples	10	10	20
		b	Dusts and wastes	10	10	20
		c	Process water	10	10	20
		Total		30	30	60
3	Dairy products	a	Raw milk cheese (cow, ewe, goat)	11	13	24
		b	Other raw milk-based products (raw milk, cream, butter, fermented milk)	10	11	21
		c	Pasteurized milk-based products (pasteurized cheese, ice cream, milk)	11	18	29
		Total		32	42	74
All categories				93	117	210

### 3.2.1.2 Artificial contamination of samples

Naturally contaminated products were preferentially analysed, but artificial contaminations were also carried out using the seeding protocol by direct inoculations of products using a liquid inoculum, followed by storage for 48-72 h at  $3^{\circ}\text{C} \pm 2^{\circ}\text{C}$  or with lyophilized strain and storage 2 weeks at ambient temperature or by spiking after heat treatment.

The artificial contaminations are presented in **Appendix 7**.

The repartition of the positive samples per inoculation protocol and inoculation level is given in Table 40.

**Table 40 - Repartition of positive naturally and artificially contaminated samples per inoculation level**

Category	Naturally contaminated	Spiking protocol		Seeding protocol		Total positive samples
		$\leq 5 \text{ CFU}$	$3 < x \leq 5,6 \text{ CFU}$	$\leq 3 \text{ CFU}$	$3 < x \leq 5,6 \text{ CFU}$	
1	18	0	0	10	3	31
2	4	0	0	21	5	30
3	7	2	0	23	0	32
Number of samples	29	2	0	54	8	93
%	31,2	2,2	0,0	58,1	8,6	100

Combining all the categories, 31.2 % of the samples were naturally contaminated.

### 3.2.1.3 Protocols applied during the validation study

#### > Enrichment broth incubation time

The minimum incubation time was evaluated for all studies.

A summary of the protocols evaluated during the extension in 2023 is shown in the table below.

**Table 41 – Summary of protocols tested**

Validation study	Protocol	Scope	Enrichment step	FDRS	Lysis step	APF <sup>5</sup>
Extension 2023	Protocol 6	Composite foods Environmental samples	LSB II for 18 h at 37°C ± 1°C	Optional	Easy II	Fast
	Protocol 7	Dairy products	Pre-warmed LSB II for 20 h at 37°C ± 1°C	Optional	Easy II	Fast

In case of PCR inhibition, 1:10 dilution of the DNA extract in sterile water was applied.

#### > Instruments

Two Real-Time PCR instruments were used: CFX96 Deep Well and CFX Opus Deep Well.

#### > Confirmation protocols

The positive PCR tests were confirmed by:

- Streaking **10 µl** of the enriched LSB II broth onto **O&A (AL)** and **PALCAM** plates incubated for 24 to 48 h at 37°C ± 1°C. The typical colonies were confirmed by the tests described in the ISO method (gram, Beta haemolysis and carbohydrates). For the study, API Listeria galleries were also used to identify the isolated colonies as this information is required for an AFNOR Validation study.
- Streaking **100 µl** of enriched LSB II broth onto Agar Listeria, RAPID'Listeria Agar, and RAPID'L.*mono* Agar incubated for 24 h at 37°C ± 1°C. For RAPID'L.*mono* and Agar *Listeria*, the only presence of typical colonies allows to confirm the positive PCR result.

---

<sup>5</sup> Application Protocol File

- An additional protocol was applied to be in agreement with the ISO 16140-2 requirements: subculture of the LSB II in Fraser broth (24 h ± 2 h at 37°C) before streaking onto O&A and PALCAM plates.

> ***Enrichment broth storage for 24 h or 72 h at 5°C ± 3°C***

The enrichment broth (LSBII) from positive and discordant samples were stored for 72 h at 5°C ± 3°C and the alternative method was tested again.

### 3.2.1.4 Test results

Raw data are given in **Appendix 8**.

The results for all categories are given in **Table 42 (CFX 96 DW- without FDRS)**, **Table 43 (CFX 96 DW - with FDRS)**, **Table 44 (CFX Opus DW - without FDRS)**, **Table 45 (CFX Opus DW - with FDRS)**.

\* Analyses performed according to the COFRAC accreditation

### > Negative deviations

The number of negative deviations varies from 17 to 18 and concerns 13 artificially contaminated samples and 7 naturally contaminated samples. The presence of *Listeria monocytogenes* was confirmed in the enrichment broth for 7 samples (3305: sandwich; 822: wipe; 1732: raw ewe milk cheese; 1733, 2752 & 2753: raw goat milk cheese; 3545: pasteurized cow cheese). For some samples with negative PCR results and positive confirmation results, several PCR tests were performed. The late Cq values obtained show that the contamination level was just at the limit of detection of the method. This explains the fact that in some conditions, positive results were observed while negative results were obtained in the other conditions.

According to the ISO 16140-2 (2016), samples in negative agreement (NA) were also confirmed by proceeding to a subculture in Fraser broth before streaking onto selective agar plates and the presence of *Listeria monocytogenes* strain was detected in the enriched LSB II broths for one sample (3670: Sandwich).

### > Positive deviations

The number of positive deviations varies from 18 to 19. They concern 12 artificially contaminated samples and 7 naturally contaminated samples.

The analyses of discordant results according to the EN ISO 16140-2:2016 for all the categories is the following (See Tables 53 to 56).

**Table 53 - Analyses of discordant results CFX96 DW - Without FDRS**

The observed values for ND+ PPND - PD meet the acceptability limit for the two individual categories tested as well as for the combined categories (calculated values  $\leq$  AL) for both extraction protocols (with or without the optional FDRS step), and both Real-Time PCR instruments (CFX 96 Deep Well or CFX Opus Deep Well).

### 3.2.1.7 Enrichment broth storage at $5 \pm 3$ °C for 24 h or 72 h

98 enriched samples were tested again after storage of the enriched LSB II broths for 72h at  $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$  with both extraction protocol and thermocyclers

The following changes were observed (see Table 57).

**Table 57 - Enrichment broth storage**

Sample N°	Product	Alternative method : iQ-Check <i>Listeria monocytogenes</i> II								Category	Type

The observed values for ND+ PPND - PD meet the acceptability limit for the two individual categories tested as well as for the combined categories (calculated values  $\leq$  AL) for both extraction protocols (with or without the optional FDRS step), and both Real-Time PCR instruments (CFX 96 Deep Well or CFX Opus Deep Well).

### 3.2.1.8 Confirmation

#### - Protocol 6

After 18 h incubation time of the LSB II broth, 3 positive PCR results (for sample 3317, 3300, 733) were not confirmed by cultural method even if additional confirmation were carried out (5 Fraser broths, 5 AL and 5 Palcam). The samples concerned as well as the PCR results observed are given in Table 62.

The percentage of false positives decrease with the addition of FDRS treatment. The presence of unconfirmed positives is therefore probably due to the presence of free DNA in the sample.

#### - Protocol 7

All positive PCR results were confirmed by cultural method. For one sample (1732: raw ewe milk cheese); five repetitions of the RAPID'L.*mono* plate were carried out to recover the *Listeria monocytogenes* strain.

**Table 62 - Number of samples unconfirmed by cultural methods**

### 3.2.1.9 PCR inhibition

420 DNA extracts prepared with and without applying the FDRS protocol were tested after incubation time and 134 after enrichment broths storage with both thermocyclers (CFX96 Deep Well and CFX Opus Deep Well), 13 PCR inhibitions were observed and concerns only 4 samples (see Table 63). A 1/10 dilution in sterile water allowed to obtain a result.

### 3.2.2 Relative level of detection

The relative level of detection is the level of detection at  $P = 0.50$  ( $LOD_{50}$ ) of the alternative (proprietary) method divided by the level of detection at  $P = 0.50$  ( $LOD_{50}$ ) of the reference method.

The RLOD is defined as the ratio of the alternative and reference methods:

$$RLOD = \frac{LOD_{Alt.}}{LOD_{Ref.}}$$

The relative detection level is the smallest number of culturable micro-organisms that can be detected in the sample in 50% of occasions by the alternative and reference methods.

#### 3.2.2.1 Experimental design

Two matrix/strain pairs were tested for the extension study using the following protocol:

- A negative control: 5 samples,
- A low contamination level providing fractional recovery data, with 20 replicates,
- A high contamination level, with 5 replicates.

A total plate count was performed to estimate the total microbial load on the day of analysis.

The extraction was performed using the Easy II protocol with and without the FDRS step. Two PCR instruments were tested: CFX 96 Deep Well and CFX Opus Deep Well.

The matrix/strain pairs tested are listed in Table 64.

**Table 64 - Defined (matrix/strain) pairs for the RLOD determination**

Category		Matrix	Strain	Origin	Inoculation and storage condition
1	Composite food	Deli salad: piémontaise	<i>Listeria monocytogenes</i> Ad1719	Vegetables mix	48-72 h at 3°C ± 2°C
2	Production environmental samples	Process water	<i>Listeria monocytogenes</i> Ad2503	Environment from vegetables production site	48-72 h at 3°C ± 2°C
3	Dairy products	Raw cow milk	<i>Listeria monocytogenes</i> Ad2858	Raw milk	48-72 h at 3°C ± 2°C

### 3.2.2.2 Calculation and interpretation of the RLOD

The raw data are given in **Appendix 9**.

The RLOD calculations were performed using the Excel spreadsheet available at <http://standards.iso.org/iso/16140> - RLOD (clause 5-1-4-2 Calculation and interpretation of RLOD) version 15.08.2015. The RLOD are given in Tables 65 to 68.

**Table 65 – Presentation of RLOD before and after confirmation  
of the alternative method results - CFX96 DW- Without FDRS**

Category		Matrix / strain pair	RLOD	RLODL	RLODU	b=ln (RLOD)	sd(b)	z-Test statistic	p-value	AL
1	Composite food	Deli salad <i>Listeria monocytogenes</i> Ad1719	0,389	0,141	1,075	-0,944	0,508	1,858	1,937	2,5

The LOD<sub>50 %</sub> calculations according to Wilrich & Wilrich POD-LOD calculation program - version 11, 2022-10-12 test are given in Table 69.

**Table 69 – LOD<sub>50</sub> results**

Category	Food item	Strain	Level of detection at 50% (CFU / sample size) according to Wilrich & Wilrich <sup>6</sup>				
			Reference method	Alternative method			
				CFX96 DW	CFX Opus DW	Without FDRS	With FDRS
1	Composite foods	Piemontaise	<i>Listeria monocytogenes</i> Ad1719	0,9 [0,5-1,7]	0,4 [0,3-0,8]	0,4 [0,3-0,8]	0,4 [0,3-0,8]
2	Production environmental samples	Process water	<i>Listeria monocytogenes</i> Ad2503	0,5 [0,3-0,8]	1,1 [0,6-2,0]	1,2 [0,7-2,3]	1,1 [0,6-2,0]
3	Dairy products	Raw milk	<i>Listeria monocytogenes</i> Ad2858	0,6 [0,4-1,1]	0,8 [0,5-1,5]	0,7 [0,4-1,3]	0,9 [0,5-1,6]
Combined				0,6 [0,5-0,9]	0,8 [0,5-1,1]	0,7 [0,5-1,1]	0,8 [0,6-1,1]
							0,8 [0,6-1,1]

### 3.2.3 Conclusion

The RLOD values (using the confirmed alternative method results) meet the acceptability limit of 2.5 for unpaired studies, for all matrix/strain pairs tested.

The combined LOD<sub>50</sub> is 0.6 CFU/test portion for the reference method and from 0.7 to 0.8 CFU/test portion for the alternative method depending on the protocol tested (without or with FDRS) and thermocycler used (CFX96 Deep Well or CFX Opus Deep Well).

## 4 INTER-LABORATORY STUDY

### 4.1 Study organization

The inter-laboratory study was performed in April 2004 according to the EN ISO 16140:2003 standard.

The participating laboratories carried out the analysis according to the method iQ-Check *Listeria monocytogenes* (protocol 1: half-Fraser broth and Standard II lysis) and the reference method (ISO 6579).

<sup>6</sup> Wilrich, C., and P.-Th. Wilrich: Estimation of the POD function and the LOD of a qualitative microbiological measurement method. AOAC International **92** (2009) 1763 - 1772.

The interlaboratory study was carried out by the expert laboratory and 15 collaborators.

Pasteurised milk inoculated with of a *Listeria monocytogenes* strain isolated from "raw milk cheese" was used for the interlaboratory study. The natural flora present in the matrix was around 41 CFU/mL.

24 samples per laboratory were prepared. divided into 3 levels. with 8 samples per level.

Due to the conditions of transport and organization, 14 laboratories were able to carry out the analyses.

## 4.2 Experimental parameter controls

The levels of contamination obtained are shown in the Table 70:

**Table 70 - Target level, real level and total viable count of the matrix**

Matrix	Total viable count (UFC/g)	Target level (cells / 25 g)	Real level (cells / 25 g)
Pasteurized milk	41	0	0
		3	4.4
		30	42.4

## 4.3 Result analysis

### 4.3.1 Expert laboratory results

The results obtained by the expert laboratory are given in Table 71.

**Table 71 – Results obtained by the expert Lab.**

Level	Reference method	Alternative method
L0	0/8	0/8
L1	8/8	8/8
L2	8/8	8/8

Sample 19 (Level 0) gave a positive PCR test with a higher Ct value than the inoculated samples (37,2), a second test was performed, and a negative result was obtained. The presence of *Listeria monocytogenes* was not confirmed in the enrichment broth for this sample.

All the spiked samples gave a positive result by both methods.

#### **4.3.2 Results observed by the collaborative laboratories**

Positive results obtained after confirmation by the reference method and the alternative method are presented in Tables 72 and 73 respectively.

**Table 72 - Reference method positive results for all laboratories**

Collaborators	Contamination level		
	L0	L1	L2
A	0	8	8
B	0	8	8
C	0	8	8
D	0	8	8
E	0	8	8
F	0	8	8
G	0	8	8
H	0	8	8
I	0	8	8
J	0	8	8
K	0	8	8
L	0	8	8
M	1	7	8
N	0	8	8
<b>Total</b>	<b>P<sub>0</sub> = 1</b>	<b>P<sub>1</sub> = 111</b>	<b>P<sub>2</sub> = 112</b>

**Table 73 - Alternative method positive results for all laboratories**

Collaborators	Contamination level								
	L0			L1			L2		
	PCR result	Confirmation result	Final result	PCR result	Confirmation result	Final result	PCR result	Confirmation result	Final result
A	1	0	0	8	8	8	8	8	8
B	0	0	0	8	8	8	8	8	8
C	0	0	0	8	8	8	8	8	8
D	0	0	0	8	8	8	8	8	8
E	0	0	0	7	8	7	8	8	8
F	1	0	0	8	8	8	8	8	8
G	0	0	0	8	8	8	8	8	8
H	0	0	0	8	8	8	8	8	8
I	0	0	0	8	8	8	8	8	8
J	0	/	0	8	8	8	8	8	8
K	0	0	0	8	8	8	8	8	8
L	1	0	0	8	8	8	8	8	8
M	1	1	1	7	7	7	8	8	8
N	2	0	0	8	8	8	8	8	8
Total	P <sub>0</sub> =6	C <sub>0</sub> =1	CP <sub>0</sub> =1	P <sub>1</sub> =110	C <sub>1</sub> =111	CP <sub>1</sub> =110	P <sub>2</sub> =112	C <sub>2</sub> =112	CP <sub>2</sub> =112

One positive PCR result was observed on unspiked samples for collaborators A, F, and L, and two positive PCR results for collaborator N. For Lab M, one confirmed positive unspiked sample (N°10) was found positive by both methods.

According to the AFNOR technical rules, it is possible to include the results from a collaborator with maximum one presumptive positive or confirmed positive sample at level 0.

This means that the results from collaborator N need to be removed for interpretation.

Lab E found one negative PCR result for Level 1 (sample N°2), the presence of Listeria monocytogenes was confirmed in the enrichment broth by the tests of the reference method. The DNA extract was tested again, and a positive result was observed (Ct 21,2).

Lab M found a negative result for sample N°8 (Level 1) by both methods.

An inversion with sample N°10 is possible for this lab.

#### 4.3.3 Results of the collaborators retained for interpretation

The results obtained with the 13 labs kept for interpretation are presented in Table 74 (reference method) and Table 75 (alternative method).

**Table 74 - Positive results by the reference method (Without Lab N)**

Collaborators	Contamination level		
	L0	L1	L2
A	0	8	8
B	0	8	8
C	0	8	8
D	0	8	8
E	0	8	8

<b>Total</b>	<b>P<sub>0</sub>=4</b>	<b>C<sub>0</sub>=1</b>	<b>CP<sub>0</sub>=1</b>	<b>P<sub>1</sub>=102</b>	<b>C<sub>1</sub>=103</b>	<b>CP<sub>1</sub>=102</b>	<b>P<sub>2</sub>=104</b>	<b>C<sub>2</sub>=104</b>	<b>CP<sub>2</sub>=104</b>

## 4.4 Calculation and interpretation

### 4.4.1 Calculation of the specificity percentage (SP)

The percentage specificities (SP) of the reference method and of the alternative method, using the data after confirmation, based on the results of level L0 are the following (See Table 76).

**Table 76 - Percentage specificity**

<b>Specificity for the reference method</b>	$SP_{ref} = \left(1 - \left(\frac{P_0}{N_-}\right)\right) \times 100 \% =$	99.1 %
<b>Specificity for the alternative method</b>	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N_-}\right)\right) \times 100 \% =$	99.1 %

N: number of all L0 tests

$P_0$  = total number of false-positive results obtained with the blank samples before confirmation

$CP_0$  = total number of false-positive results obtained with the blank samples

#### **4.4.2 Calculation of the sensitivity ( $SE_{alt}$ ), the sensitivity for the reference method ( $SE_{ref}$ ), the relative trueness (RT) and the false positive ratio for the alternative method (FPR)**

A summary of the results of the collaborators retained for interpretation and obtained with the reference and the alternative methods for Level 0, Level 1 and Level 2 is provided in Table 77.

**Table 77 - Summary of the obtained results with the reference method and the alternative method for Level 0, Level 1 and Level 2**

Level	Response	Reference method positive (R+)	Reference method negative (R-)
0	Alternative method positive (A+)	Positive agreement (A+/R+) <b>PA = 1</b>	Positive deviation (R-/A+) <b>PD = 0</b>
	Alternative method negative (A-)	Negative deviation (A-/R+) <b>ND = 0 (PPND=0)</b>	Negative agreement (A-/R-) <b>NA = 111 (PPNA=5)</b>
1	Alternative method positive (A+)	Positive agreement (A+/R+) <b>PA = 110</b>	Positive deviation (R-/A+) <b>PD = 0</b>
	Alternative method negative (A-)	Negative deviation (A-/R+) <b>ND = 1 (PPND=0)</b>	Negative agreement (A-/R-) <b>NA = 1 (PPNA=0)</b>
2	Alternative method positive (A+)	Positive agreement (A+/R+) <b>PA = 112</b>	Positive deviation (R-/A+) <b>PD = 0</b>
	Alternative method negative (A-)	Negative deviation (A-/R+) <b>ND = 0 (PPND=0)</b>	Negative agreement (A-/R-) <b>NA = 0 (PPNA=0)</b>

Fractional positive results were obtained for the low inoculation level (L1). This inoculation level was retained for calculation.

Based on the data summarized in Table 77, the values of sensitivity of the alternative and reference methods, as well as the relative trueness and false positive ratio for the alternative method taking account the confirmations, are the following (See Table 78).

**Table 78 - Sensitivity, relative trueness and false positive ratio percentages**

		Level 1
<b>Sensitivity for the alternative method:</b>	$SE_{alt} = \frac{(PA+PD)}{(PA+PD+ND)} \times 100\% =$	99.1%
<b>Sensitivity for the reference method:</b>	$SE_{ref} = \frac{(PA+ND)}{(PA+PD+ND)} \times 100\% =$	100%
<b>Relative trueness</b>	$RT = \frac{(PA+NA)}{N} \times 100\% =$	99.1%
<b>False positive ratio for the alternative method</b>	$FPR = \frac{FP}{NA} \times 100\% =$	0.0%

#### 4.4.3 Interpretation of data

For a **paired study design**, the difference between (ND – PD) and the addition (ND + PD) are calculated for the level(s) where fractional recovery is obtained ( $L_1$ ). The observed value found for (ND – PD) and (ND + PD) shall not be higher than the AL.

For 13 Labs, the calculated values and the acceptability limits are the following:

**Table 79 – Calculations**

	Calculated values	AL	Conclusion
ND - PD	1	4	ND-PD<AL
ND + PD	1	5	ND+PD<AL

**The ISO 16140-2 (2016) requirements are fulfilled as ND - PD and ND + PD meet the acceptability limits defined in the EN ISO 16140-2:2016.**

#### 4.4.4 Evaluation of the LOD<sub>50%</sub>, LOD<sub>95%</sub> and RLOD between laboratories

The RLOD was calculated using the EN ISO 16140-2:2016 Excel spreadsheet available at [https://standards.iso.org/iso/16140/-5/ed-1/en/RLOD\\_inter-lab-study\\_16140-2\\_AnnexF\\_ver1\\_28-06-2017.xls](https://standards.iso.org/iso/16140/-5/ed-1/en/RLOD_inter-lab-study_16140-2_AnnexF_ver1_28-06-2017.xls). The results are used only for information (see Table 80).

**Table 80 - LOD<sub>50%</sub>, LOD<sub>95%</sub> and RLOD**

Method	LOD 50%	LOD 95%	RLOD
Reference	Every inoculated sample is positive except for Lab M, calculation is impossible		Value not available as there is no result for the reference method
Alternative	0.67 [0.43;1.03]	2.89 [1.87;4.47]	

## 5 CONCLUSION

---

The **method comparison study conclusions** are:

**For the initial validation study and extension/renewal studies – Half-Fraser and LSB protocol**

- ☒ The study scheme corresponds to PAIRED STUDY design for protocol 1 and to an UNPAIRED STUDY design for protocols 2, 3, 4 and 5.
- ☒ In the sensitivity study, 6 categories were tested: 5 food categories and environmental samples. The ND – PD (paired and unpaired study) and ND+ PD (paired study) meet the acceptability limits (AL) whatever the category and protocol tested.
- ☒ The Relative Levels of Detection (RLOD) are all below the AL fixed at 1, 5 for the paired data study and at 2.5 for the unpaired data study for all the protocols tested.
- ☒ The inclusivity and exclusivity testing gave the expected results whatever the protocol tested.
- ☒ It is possible to store the primary enrichment broth for 72 h at 5 ± 3°C.
- ☒ The alternative method fulfils all the EN ISO 16140-2:2016 and AFNOR technical rules (PR revision 7).

**For the extension study for the use of LSB II medium (2023)**

- ☒ The extension study scheme corresponds to an UNPAIRED study design as the alternative and reference methods have different enrichment procedure.
- ☒ In the sensitivity study, 3 categories were tested: two food category and the production environmental samples.
- ☒ The calculated values for ND+ PPND - PD meet the acceptability limits (AL) for composite food and environmental categories for all conditions tested.
- ☒ The calculated values for ND+ PPND - PD meet the acceptability limits (AL) for each of the individual category, and as well for the 3 categories tested with LSBII whatever the protocols tested (without or with FDRS) and thermocycler used (CFX96 Deep Well or CFX Opus Deep Well).
- ☒ The number of positive presumptive non-confirmed samples (PPNA and PPND) was significantly reduced by applying the FDRS protocol.
- ☒ It is possible to store the LSB II enriched samples for 72 h at  $5^{\circ}\text{C} \pm 3^{\circ}\text{C}$  before proceeding to PCR test and confirmation.
- ☒ The Relative Levels of Detection (RLOD) are all below the AL fixed at 2.5 for the unpaired data study whatever the matrix/strain pairs.

The inter-laboratory study conclusions are:

- ☒ The data and interpretations comply with the EN ISO 16140-2:2016 requirements. **The iQ-Check *Listeria monocytogenes* II is considered equivalent to the ISO standard.**

Quimper, 16 November 2023

Florian QUERO

Technical Study Manager

Validation of Alternative methods

I hereby attest to the validation of the results of the analyses carried out under the COFRAC accreditation.

Maryse RANNOU

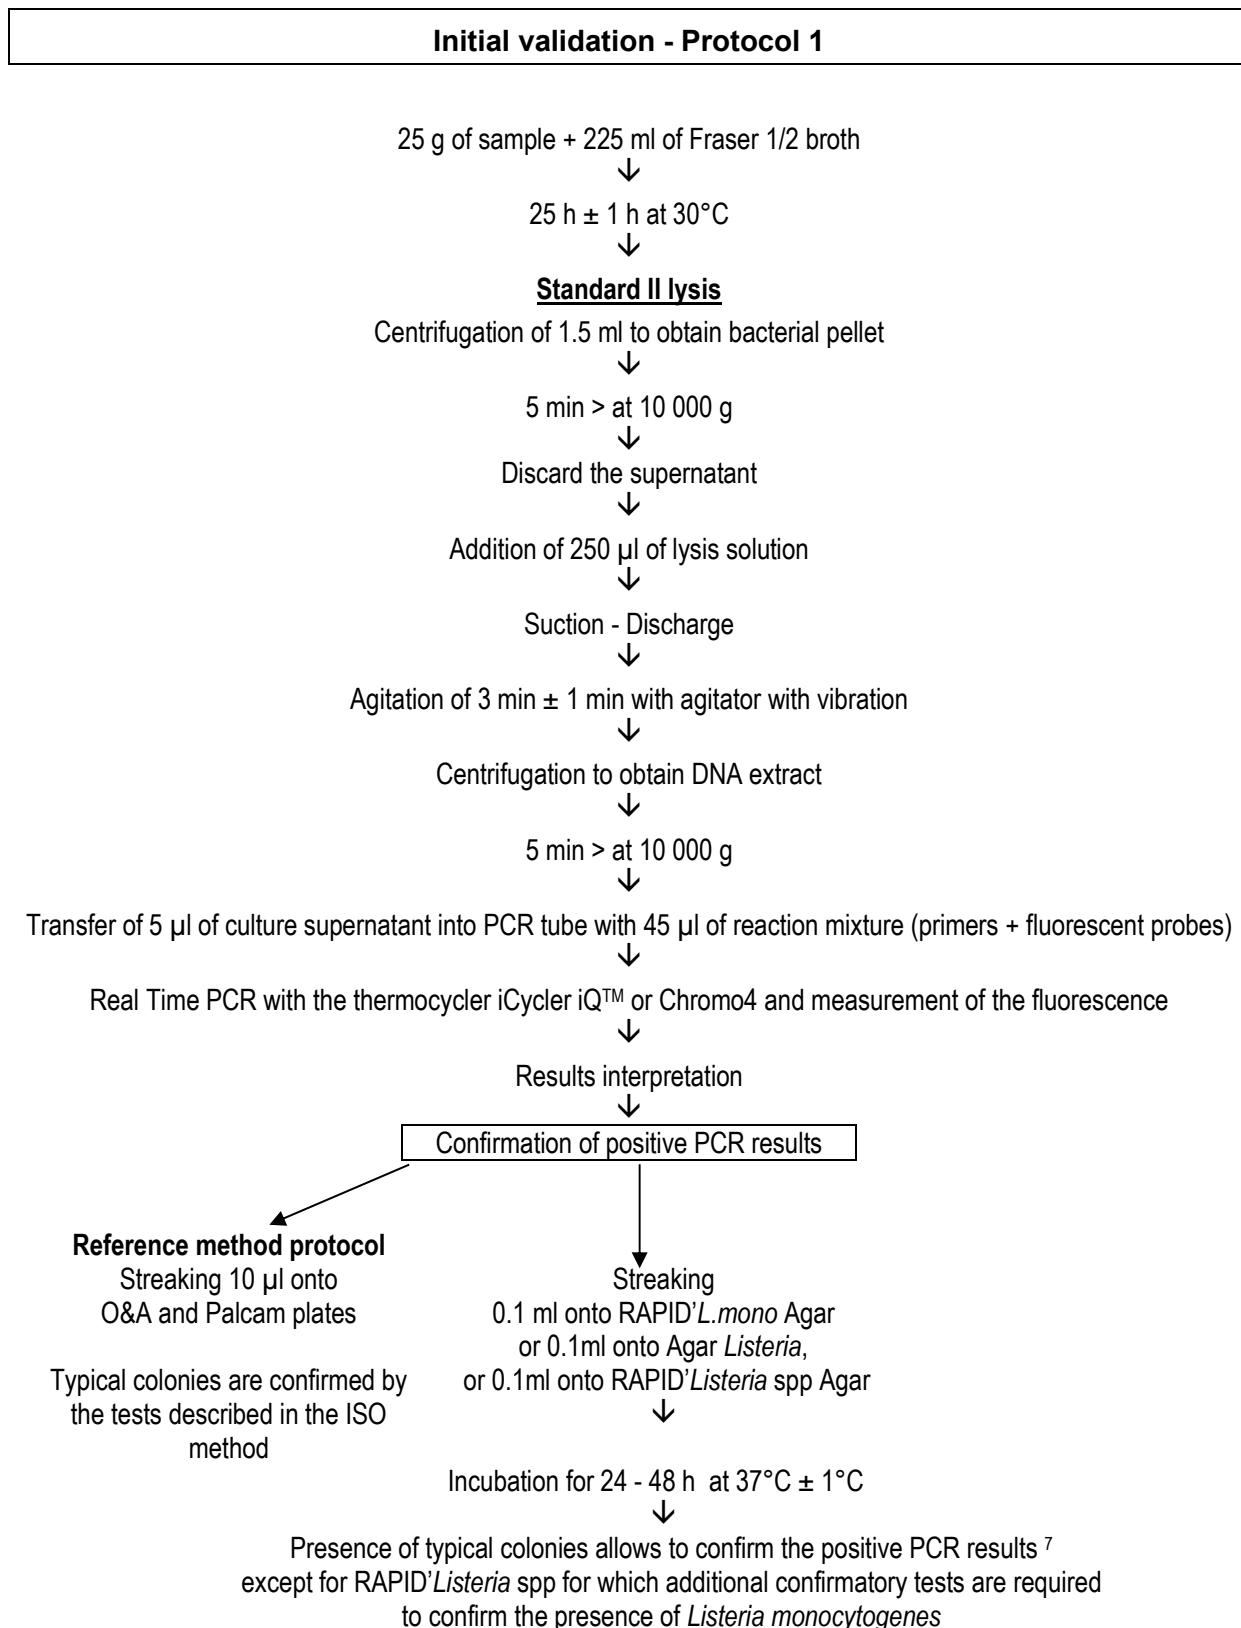

Project Manager

Validation of Alternative methods

I hereby attest to the validation of the verification of the conformity of the report (opinion and interpretation).

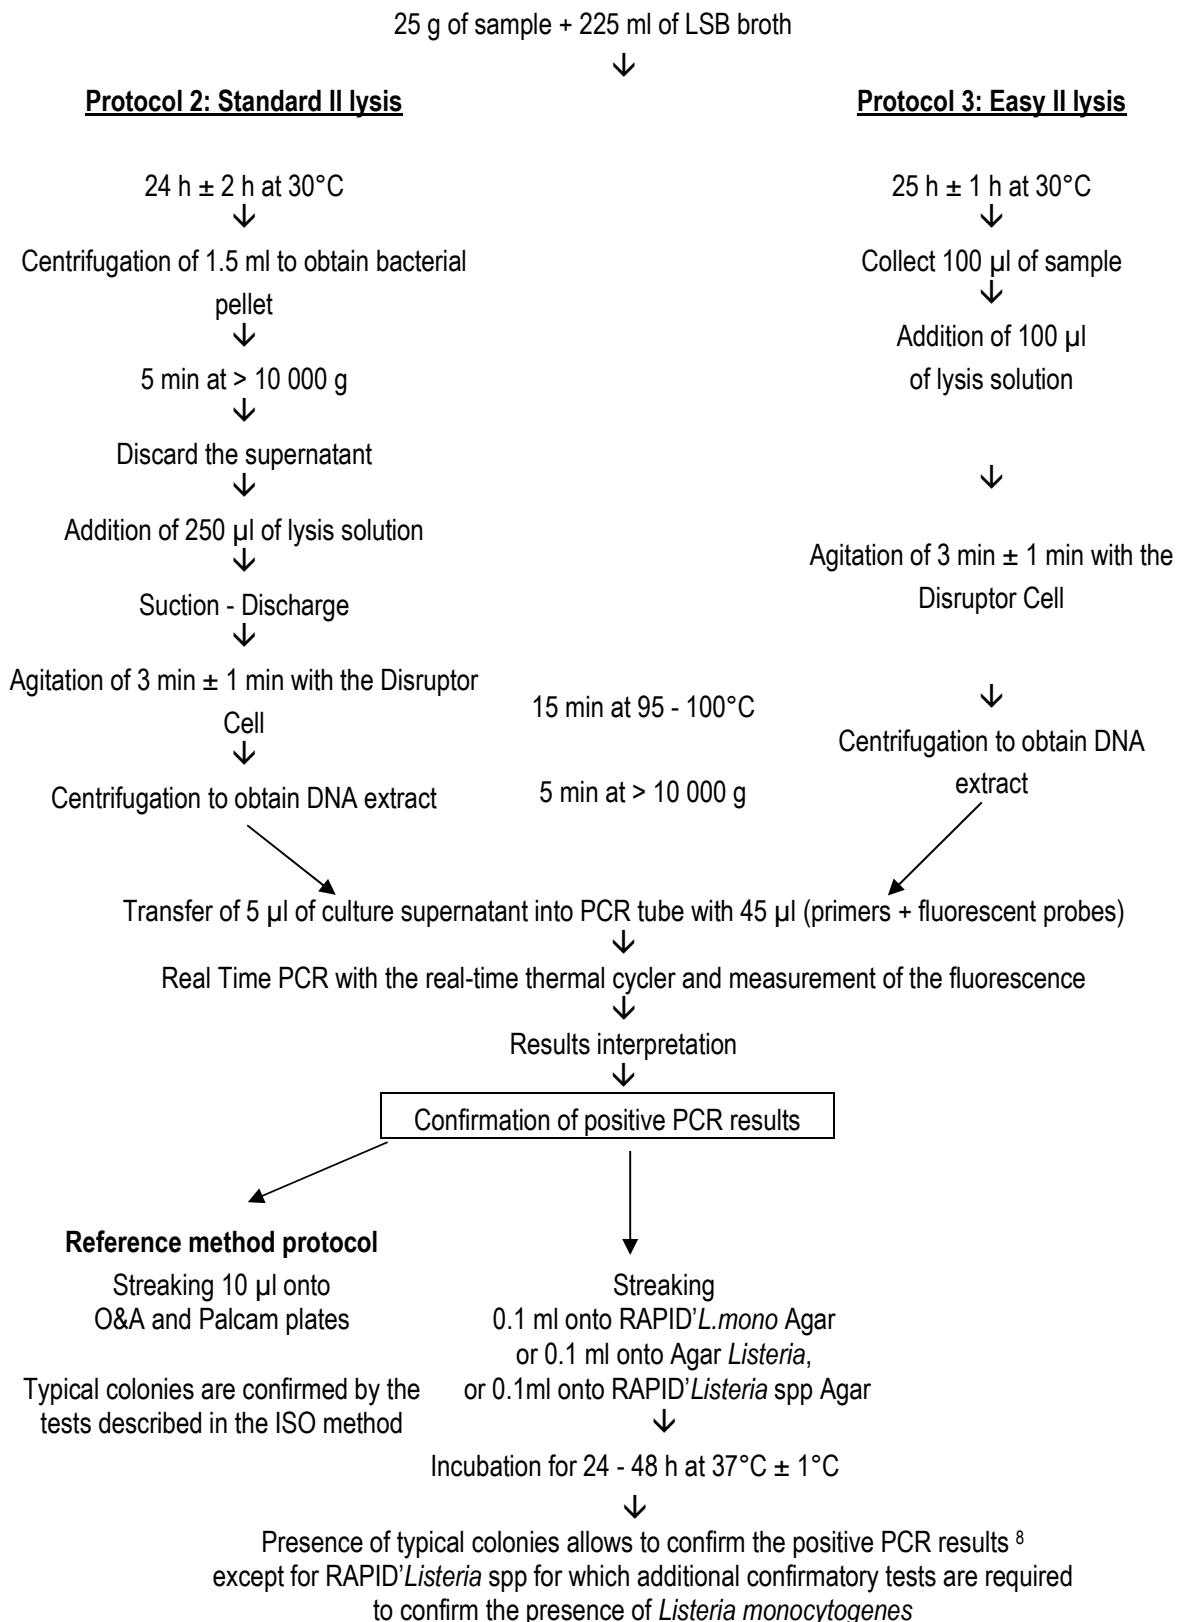

**Appendix 1 – Flow diagram of the alternative method:  
iQ-Check *Listeria monocytogenes***

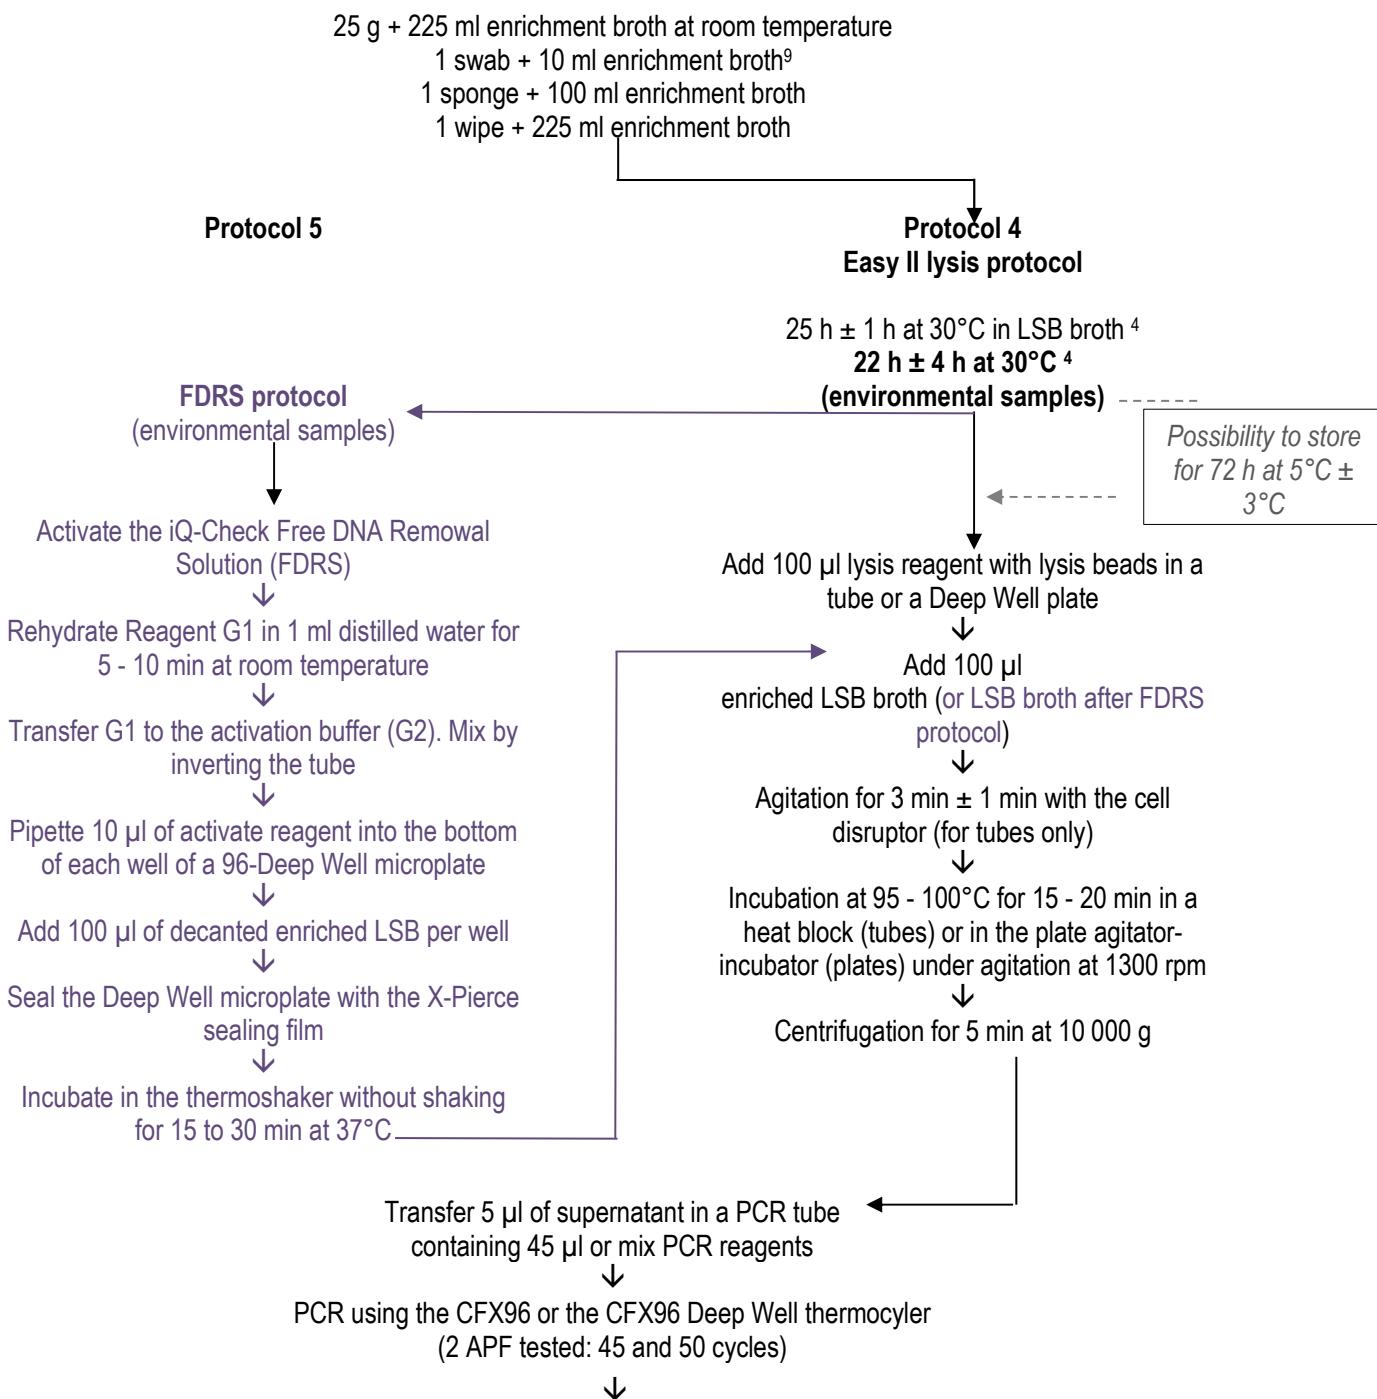

<sup>7</sup> During the validation study, the typical colonies were confirmed using the tests described in the reference method (Catalase, β haemolysis, Rhamnose, Xylose). One colony was identified per sample using mini-biochemical galleries.

## Enrichment in LSB broth

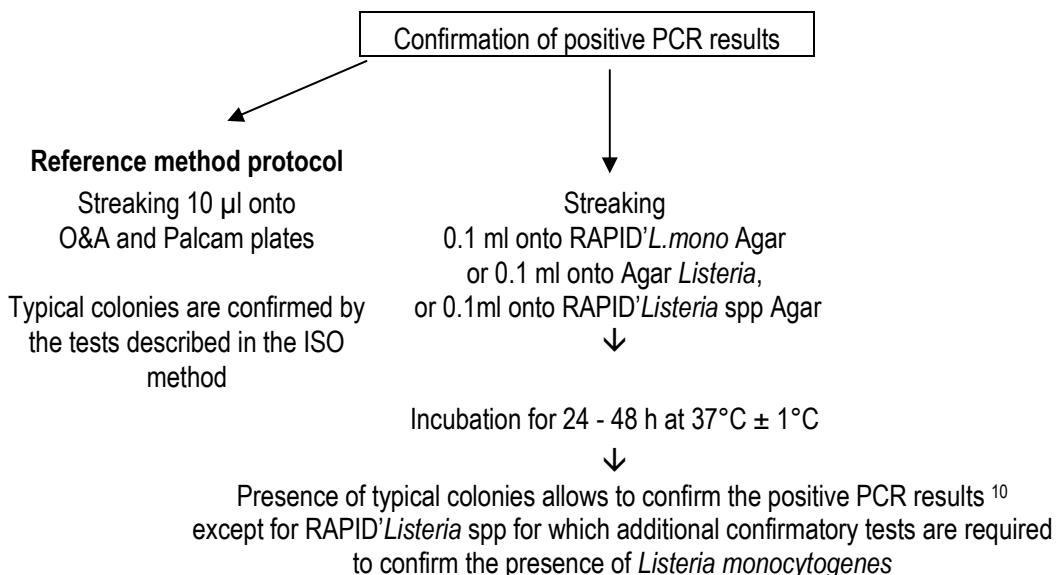

### Extension study (2006) - Protocols 2 and 3

<sup>8</sup> During the validation study, the typical colonies were confirmed using the tests described in the reference method (Catalase, β haemolysis, Rhamnose, Xylose). One colony was identified per sample using mini-biochemical galleries.

**Extension study (2019) - ADRIA Développement****Protocols 4 and 5 (Environmental samples)**

<sup>9</sup> For sampling after cleaning process pre-moisten  
 - 1 swab + 1 ml broth universal neutralizing (+ 9 ml Half Fraser or LSB)  
 - 1 sponge + 10 ml broth universal neutralizing (+ 90 ml Half Fraser or LSB)  
 - 1 wipe + BPW + 10 % neutralizing agent (+ 225 ml Half Fraser or LSB)

<sup>10</sup> During the validation study, the typical colonies were confirmed using the tests described in the reference method (Catalase,  $\beta$  haemolysis, Rhamnose, Xylose). One colony was identified per sample using mini-biochemical galleries.

## Enrichment in LSB II broth

**For food products:**

25 g + 225 ml LSB II broth at room temperature (composite food) incubation  
or prewarmed (Dairy products)

**For environmental samples:**

25 g + 225 ml LSB II broth at room temperature  
1 swab + 10 ml LSB II broth<sup>11</sup> at room temperature  
1 sponge + 100 ml LSB II broth at room temperature  
1 wipe + 225 ml LSB II broth at room temperature

Incubation 18 h - 26 h at 37°C (composite and environment samples)

Incubation 20 h - 28 h at 37°C (Dairy products)

*Possibility to store the enriched samples  
for 72 h at 5°C±*

**FDRS protocol (optional)**

Rehydrate Reagent G1 in 1 ml distilled water for 5 - 10 min  
at room temperature

Transfer G1 to the activation buffer (G2). Mix by inverting  
the tube

Pipette 10 µl of activate reagent into the bottom of each  
well of a 96-Deep Well microplate

Add 100 µl of decanted enriched LSB II per well

Seal the Deep Well microplate with the X-Pierce sealing  
film

Incubate in the thermoshaker without shaking for  
15 to 30 min at 37°C

Transfer 5 µl of supernatant in a PCR tube  
containing 45 µl of mix PCR reagents

PCR using the CFX96 Deep Well or the CFX OPUS Deep Well thermocycler  
(APF Fast tested)

Confirmation of  
positive PCR results

**Alternative method protocol:**

0.1 ml onto Agar *Listeria*, RAPID'*Listeria* Agar, and RAPID'*L.mono* Agar  
Incubation 24 h at 37°C ± 1°C

**Easy II protocol:**

Add 100 µl lysis reagent with lysis beads in a tube  
or a Deep Well plate

Add 100 µL of decanted enriched LSB II or 100 µL  
FDRS treated sample

Agitation for 3 min ± 1 min with the cell disruptor  
(for tubes only)

Incubation at 95 - 100°C  
for 15 - 20 min in a heat block (tubes) or in the plate  
agitator-incubator (plates and tubes) under agitation  
at 1300 rpm

Centrifugation for 5 min  
at 10 000 g

11 For sampling after cleaning process pre-moisten

- 1 swab + 1 ml broth universal neutralizing (+ 9 ml LSB)
- 1 sponge + 10 ml broth universal neutralizing (+ 90 ml LSB)
- 1 wipe + BPW + 10 % neutralizing agent (+ 225 ml LSB)

**Reference method protocol:**

10 µl onto O&A (AL) and Palcam  
Incubation for 24 - 48 h at 37°C ± 1°C  
↓

Presence of typical colonies allows to confirm the positive PCR results  
for Agar *Listeria* and RAPID'*L.mono* for the alternative confirmation protocol. For the reference method protocol,  
the typical colonies are confirmed  
using the tests described in the ISO method\*

\* During the validation the colonies were also tested by biochemical gallery for identification

**Appendix 2 – Flow diagram of the reference method: ISO 11290-1 (May 2017):  
Microbiology of the food chain - Horizontal method for the detection and enumeration  
of *Listeria monocytogenes* and of *Listeria* spp.- Part 1: detection method**

Test portion (25 g or 25 mL) + 225 mL Half Fraser broth

1 swab + 10 mL Half Fraser broth<sup>12</sup>

1 sponge + 100 mL Half Fraser broth

1 wipe + 225 mL Half Fraser broth

Primary enrichment medium (Half Fraser broth)

Incubation at 30°C ± 1°C 24 h to 26 h

0.1 ml of culture  
in 10 mL of secondary  
enrichment medium (Fraser broth)

Incubation at 37°C ± 1°C  
for 24 h ± 2 h

Plating out on Agar *Listeria* according to  
Ottaviani and Agosti and second selective medium

Incubation of Agar *Listeria* according to  
Ottaviani and Agosti for 24 h ± 2 h and an additional 24 h ± 2 h at 37°C ± 1°C  
Incubation of second selective medium according to the chosen medium  
as specified by the manufacturer

Confirmation

**Appendix 8 – Sensitivity study: raw data - Enrichment in LSB II broth  
(Extension study, 2023)**

**Bold typing : artificially inoculated samples**

**Listeria detection results:**

DW            Deep Well  
H+:            characteristic Listeria colonies with halo  
H-:            characteristic Listeria without halo  
-:            no typical colonies but presence of background microflora  
st:            plate without any colony  
PA:            positive agreement  
NA:            negative agreement  
ND:            negative deviation  
PD:            positive deviation  
PPNA:        positive presumptive negative agreement  
PPND :        positive presumptive negative deviation  
NC:            non-characteristic colony on TSYEA  
d:            doubtful colony  
\*:            result after enrichment broth dilution at 1/10  
NI:            no identification  
ni :            not isolated colony
