## Preamble

- Protocols of validation :

- **EN ISO 16140-1 and EN ISO 16140-2 (September 2016): Microbiology of the food chain — Method validation**  
Part 1: Vocabulary.  
Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method.
- **Requirements regarding comparison and interlaboratory studies for implementation of the standard EN ISO 16140-2 (project version 7).**

- Reference method:

- **EN ISO 11290-1 (July 2017): Microbiology of the food chain - Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria* spp- Part 1: Detection method.**

- Application scope:

- **All human food products** by a validation testing of a broad range of foods, including:
  - meat products,
  - milk and dairy products,
  - fish and seafood,
  - vegetables,
  - composite foods,
- **Environmental samples.**

- Certification body:

- **AFNOR Certification (<https://nf-validation.afnor.org/>).**

## Definitions

- **Method comparison study**

The method comparison study is the part of the validation process that is performed in the organizing laboratory. It consists of three parts namely the following:

- A comparative study of the results of the reference method to the results of the alternative method in (naturally and/or artificially) contaminated samples (so-called sensitivity study);
- A comparative study to determine the relative level of detection (RLOD) in artificially contaminated samples (so-called RLOD study);
- An inclusivity/exclusivity study of the alternative method.

- **Sensitivity study**

The sensitivity study aims to determine the difference in sensitivity between the reference and the alternative method.

The sensitivity is the ability of the reference method or alternative method to detect the analyte.

- **Relative level of detection study**

A comparative study is conducted to evaluate the level of detection (LOD) of the alternative method against the reference method. The evaluation is based on the calculation of the relative level of detection (RLOD).

The level of detection at 50% ( $LOD_{50}$ ) is the measured analyte concentration, obtained by a given measurement procedure, for which the probability of detection is 50%.

The relative level of detection level of detection at  $P = 0,50$  ( $LOD_{50}$ ) of the alternative method divided by the level of detection at  $P = 0,50$  ( $LOD_{50}$ ) of the reference method.

- **Inclusivity and exclusivity study**

The inclusivity study is a study involving pure target strains to be detected or enumerated by the alternative method.

The exclusivity study is a study involving pure non-target strains, which can be potentially cross-reactive, but are not expected to be detected or enumerated by the alternative method.

- **Interlaboratory study**

The interlaboratory study is a study performed by multiple laboratories testing identical samples at the same time, the results of which are used to estimate alternative-method performance parameters.

The aim of the interlaboratory study is to determine the difference in sensitivity between the reference and the alternative method when tested by different collaborators using identical samples (reproducibility conditions).

Appendix D: Results of the sensitivity study

Appendix E: Results of the relative level of detection study

Appendix F: Results of the selectivity study

Appendix G: Results of the interlaboratory study

## 1. Introduction

The present document is a summary report of the validation AFNOR Certification of the ANSR for *Listeria monocytogenes* method.

The ANSR for *Listeria monocytogenes* method is certified NF VALIDATION for a validation according to the ISO 16140-2:2016 standard under the certification number NEO 35/04-03/16 for the detection of *Listeria monocytogenes* in a broad range of foods and in environmental samples.

Table 1 summarizes the different steps of the validation that occurred since the initial validation.

*Table 1: validation history*

Date	Study	Expert Laboratory	Standards
March 2016	Initial validation for the detection of <i>Listeria monocytogenes</i>	ADRIA Développement	- ISO/FDIS 16140-2:2015 - ISO 11290-1/A1:2005
November 2019	First renewal study without modification	Microsept	- ISO 16140-2:2016 - ISO 11290-1:2017
December 2023	Project of second renewal study without modification	Microsept	- ISO 16140-2:2016 - ISO 11290-1:2017

The results set out in this report were produced during validation tests carried out by ADRIA Développement as part of NF Validation, in accordance with prevailing requirements.

## 2. Protocols of the methods

### 2.1. Alternative method

#### 2.1.1. Principle of the alternative method

ANSR for *Listeria monocytogenes* is an isothermal, amplified nucleic acid assay. The ANSR for *Listeria monocytogenes* method is based on nicking enzyme amplification reaction (NEAR™) technology. Target DNA is amplified through a mechanism of polymerization from the ends of nicks created in double-stranded DNA by the action of a specific endonuclease. Amplified target sequences are detected in real time using fluorescent molecular beacon probes.

A two-stage lysis reaction is performed, first at  $37 \pm 2^\circ\text{C}$  for 10 minutes, then at  $80 \pm 2^\circ\text{C}$  for 20 minutes. Next, a portion of the lysed sample is transferred to a strip tube containing lyophilized ANSR reagents. The tubes are sealed and incubated at  $56 \pm 1^\circ\text{C}$  on the ANSR reader. Results are generated by the reader and displayed in the ANSR software within 10 minutes. Positive results may be confirmed from the enrichment cultures following standard procedures. Each tube of ANSR reagents contains an internal positive control, ensuring that the reagents are functioning properly.

#### 2.1.2. Protocol of the alternative method

The validated protocol is as follows:

- Enrichment step in LESS Plus broth for  $27 \pm 3$  h at  $30 \pm 1^\circ\text{C}$
- Lysis step:
  - o 50 µl enrichment broth + 450 µl lysis buffer,
  - o Incubation at  $37^\circ\text{C}$  for 10 min in a heater block,
  - o Heat treatment at  $80^\circ\text{C}$  for 20 min.
- Polymerization step,
- Confirmation tests by streaking 100 µl of LESS Plus broth onto Ottaviani & Agosti or RAPID'L.*mono* agar media.

During the validation study, the typical colonies were confirmed by the tests described in the ISO 11290-1/A1:2005 method.

The protocol of the method is set out in Appendix A.

### 2.2. Reference method

Assays of the initial validation for the general protocol were performed according to the EN ISO 11290-1/A1:2005 standard "Horizontal method for the detection and enumeration of *Listeria monocytogenes* - Part 1: Detection method".

This standard was updated in 2017, that's why the method described in the new standard EN ISO 11290-1:2017 "Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria* spp – Part 1: detection method" is considered as the reference method as part of the current renewal study performed by the Laboratory Microsept.

The main changes introduced in the ISO 11290-1:2017 are considered as major but the technical changes were assessed and were considered to have no significant effect on the method performance characteristics or test results.

The results obtained with the reference method during the initial validation are consequently considered as still effective as part of the renewal study.

The analytical scheme of the reference method is presented in Appendix B.

### **2.3. Restriction**

There is no restriction on use for the ANSR for *Listeria monocytogenes* method.

### **2.4. Study design**

As there is no shared enrichment step for both the alternative and the reference methods, different test portions coming from the same batch or lot of products have to be used for the two methods. The study thus provides unpaired data and the expression “unpaired study” is used to describe the study design.

### 3. Method comparison study

#### 3.1. Sensitivity study

The study was conducted on a variety of samples and strains representative of food products. This is not an exhaustive list of the various matrices included in the application scope. For any remark on the alternative method, you can contact AFNOR Certification by connecting to the Internet page <http://nf-validation.afnor.org/contact-2/>.

##### 3.1.1. Number and nature of samples

542 samples contaminated and non-contaminated with *Listeria monocytogenes* were tested using both the EN ISO 11290-1/A1:2004 reference method and the ANSR for *Listeria monocytogenes* method.

The different kinds of samples analyzed are presented in table 2.

*Table 2: Number and nature of samples analyzed for all categories (¹ : positive by any method)*

Category	Type	Number of positive results <sup>1</sup>	Number of negative results	Total
Composite foods ①	a Ready-to-eat	10	19	29
	b Ready-to-reheat	14	14	28
	c Confectionaries, pastries and egg prod	13	27	40
	<b>Total</b>	<b>37</b>	<b>60</b>	<b>97</b>
Meat products ②	a Raw products (frozen or fresh)	16	13	29
	b Meat based products ready to reheat	10	14	24
	c Raw and cooked delicatessen	9	21	30
	<b>Total</b>	<b>35</b>	<b>48</b>	<b>83</b>
Milk & dairy products ③	a Raw milk cheeses	10	23	33
	b Other products based on raw milks	15	13	28
	c Heat treated dairy products	9	16	25
	<b>Total</b>	<b>34</b>	<b>52</b>	<b>86</b>
Vegetables ④	a Raw products (fresh and frozen)	12	20	32
	b Pre-cooked vegetables, vegetables under modified atmosphere	12	23	35
	c RTE	13	16	29
	<b>Total</b>	<b>37</b>	<b>59</b>	<b>96</b>
Fish and seafood ⑤	a Raw products (fresh and frozen)	17	18	35
	b Cured & smoked	17	8	25
	c Ready-to-eat, Ready to reheat	14	22	36
	<b>Total</b>	<b>48</b>	<b>48</b>	<b>96</b>
Environmental samples ⑥	a Process & cleaning waters	12	15	27
	b Dusts and residus	8	13	21
	c Surface sampling	11	25	36
	<b>Total</b>	<b>31</b>	<b>53</b>	<b>84</b>
<b>TOTAL</b>		<b>222</b>	<b>320</b>	<b>542</b>

### **3.1.2. Artificial contamination of samples**

Artificial contamination was carried out using stressed strains in accordance with the requirements of the ISO 16140-2:2016 standard and of the requirements of the AFNOR Validation Technical Board linked to this standard.

A total of 112 samples were artificially contaminated, using 56 different strains:

- 81 gave a positive result, among which:
  - o 68 samples were inoculated at level  $\leq 3$  CFU / test portion,
  - o 13 samples were inoculated between 3.2 and 7.2 CFU / test portion.

In total, 141 positive results out of 222 were obtained following artificial contaminations, i.e. 63.5%.

The samples and the strains used for the artificial contaminations are presented in Appendix C.

### **3.1.3. Confirmation protocols**

The positive ANSR tests were confirmed by streaking 100  $\mu$ l of the LESS broth onto Ottaviani & Agosti and RAPID'L.*mono* agar media.

During the validation study, the typical colonies were identified by the tests described in the reference method.

### **3.1.4. Results**

Raw data are shown in Appendix D.

Table 4 shows the results for the two methods.

*Table 4: results of the sensitivity study for both methods (R+/-: reference method positive or negative, A+/-: alternative method positive or negative, PA: positive agreement, NA: negative agreement, ND: negative deviation, PD: positive deviation, PP: presumptive positive before confirmation). PPNA are included in NA. PPND are included in ND.*

Category	Response	R+	R-
<b>Composite foods</b> <b>①</b>	A+	PA = 22	PD = 8

### 3.1.5. Calculation of relative accuracy (AC), relative sensitivity (SE) and false positive ratio (FP)

All results were used to calculate the sensitivity for the alternative method and the reference method, the relative trueness and the false positive ratio.

Table 5 presents the results.

Table 5: values in % of sensitivity for the two methods, relative trueness and false positive ratio for the alternative method ( $SE_{alt}$ : sensitivity for the alternative method,  $SE_{ref}$ : sensitivity for the reference method, RT: relative trueness, FPR: false positive ratio for the alternative method). PPNA are included in NA. PPND are included in ND.

Category	Type		PA	NA	PD	ND	PPND	PPNA	$SE_{alt}$ %	$SE_{ref}$ %	AC %	FP %
Composite foods ①	a	Ready-to-eat	5	19	3	2	0	0	80.0	70.0	82.8	0.0
	b	Ready-to-reheat	7	14	3	4	0	0	71.4	78.6	75.0	0.0
	c	Confectionaries, pastries and egg products	10	27	2	1	0	0	92.3	84.6	92.5	0.0
	Total		22	60	8	7	0	0	81.1	78.4	84.5	0.0
Meat products ②	a	Raw products (frozen or fresh)	10	13	3	3	0	0	81.3	81.3	79.3	0.0

	Total		18	53	6	7	0	0	77.4	80.6	84.5	0.0
Total			137	320	43	42	0	1	81.1	80.6	84.3	0.3

Table 6 summarizes the calculated parameters for all categories per kind of samples.

*Table 6: parameters for all categories per kind of samples (ND=ND+PPND, NA=NA+PPNA)*

Parameter	Formula EN ISO 16140-2 :2016	Value
<b>Sensitivity of the alternative method (SE<sub>alt</sub>)</b>	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100 \%$	<b>81.1 %</b>
<b>Sensitivity of the reference method (SE<sub>ref</sub>)</b>	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100 \%$	<b>80.6 %</b>
<b>Relative trueness (RT)</b>	$RT = \frac{(PA + NA)}{N} \times 100 \%$	<b>84.3 %</b>
<b>False positive ratio (FPR)</b> <b>False positive results are the sum of PPNA and PPND</b>	$FPR = \frac{FP}{NA} \times 100 \%$	<b>0.3 %</b>

### 3.1.6. Analysis of discordant results

The negative deviations are given in table 7, the negative agreements recovered from the alternative method broth in table 8 and the positive deviations in table 9.

42 negative deviations were observed, 18 from artificially contaminated samples and 24 from naturally contaminated samples. For 8 samples, the presence of *Listeria monocytogenes* was detected in the LESS Plus Broth by the confirmation tests; one additional sample (5621) was confirmed by applying a subculture of LESS Plus Broth in Fraser prior streaking onto selective agar plates. 33 negative deviations were probably due to the unpaired study design and the related sampling heterogeneity.

43 positive deviations were observed. 28 concern naturally contaminated samples and 15 artificially contaminated samples.

The number of observed deviations confirms the low levels of the inoculation or natural contamination.

Table 7: summary of negative deviations

Sample N°	Product	Strain inoculated	Inoculation level (CFU/sample)	ANSR for <i>L. monocytogenes</i>		Reference method on LESS Plus broth	Category	Type

### 3.1.7. Calculation and interpretation of data

For each category and for all categories, the difference between ND and PD is calculated. The values obtained are compared to the acceptability limits defined by the ISO 16140-2:2016 standard.

Table 10 shows these results.

*Table 10: acceptability limits*

Cate-gory	Type	Values				
		PD	ND	PPND	ND+PPND-PD	AL
①	a Ready-to-eat	3	2	0	/	/
	b Ready-to-reheat	3	4	0		
	c Confectionaries, pastries and egg products	2	1	0		
	<b>Total</b>	<b>8</b>	<b>7</b>	<b>0</b>	<b>-1</b>	<b>3</b>
②	a Raw products (frozen or fresh)	3	3	0	/	/
	b Meat based products ready to reheat	2	3	0		
	c Raw and cooked delicatessen	1	3	0		
	<b>Total</b>	<b>6</b>	<b>9</b>	<b>0</b>	<b>3</b>	<b>3</b>
③	a Raw milk cheeses	2	2	0	/	/
	b Other products based on raw milks	1	3	0		
	c Heat treated dairy products	1	1	0		
	<b>Total</b>	<b>4</b>	<b>6</b>	<b>0</b>	<b>2</b>	<b>3</b>
④	a Raw products (fresh and frozen)	2	2	0	/	/
	b Pre-cooked vegetables, vegetables under modified atmosphere	3	2	0		
	c RTE	3	3	0		
	<b>Total</b>	<b>8</b>	<b>7</b>	<b>0</b>	<b>-1</b>	<b>3</b>
⑤	a Raw products (fresh and frozen)	3	4	0	/	/
	b Cured & smoked	6	0	0		
	c Ready-to-eat, Ready to reheat	2	2	0		
	<b>Total</b>	<b>11</b>	<b>6</b>	<b>0</b>	<b>-5</b>	<b>3</b>
⑥	a Process & cleaning waters	2	1	0	/	/
	b Dusts and residus	2	2	0		
	c Surface sampling	2	4	0		
	<b>Total</b>	<b>6</b>	<b>7</b>	<b>0</b>	<b>1</b>	<b>3</b>
<b>Total</b>		<b>43</b>	<b>42</b>	<b>0</b>	<b>-1</b>	<b>6</b>

The observed values are below or equal to the acceptability limits for each category and for the combined categories.

The alternative method produces results comparable to the reference method.

### 3.1.8. Enrichment broth storage at 2 - 8°C for 72 h

A stability study of the enriched broths stored at 5±3°C for 72 hours was performed on all positive and discordant samples. After storage, the broths were reanalyzed and confirmed. The following changes are observed (cf. table 11).

*Table 11: results modifications after storage of the broth at 2-8°C*

Category	Sample N°	Before storage	After storage
4	3917	ND	PA
1	2904	NA	PD
4	3821	NA	PD
5	3913	PA	ND
5	3921	PD	NA
5	4124	ND	PA
5	4750	ND	PA
4	4284	NA	PD
6	4389	NA	PD
6	4397	PA	ND
4	1985	ND	PA
5	3916	ND	PA
1	4837	ND	PA
2	5432	NA	PD
3	5642	NA	PD
3	5669	PA	ND
3	7984	NA	PD

Table 12 shows the differences between ND and PD and the acceptability limits after storage.

Table 12: acceptability limits after storage of the enriched broths

Category	Type	Values				
		PD	ND	PPND	ND+PPND-PD	AL
①	a Ready-to-eat	4	1	0	/	/
	b Ready-to-reheat	3	3	0		
	c Confectionaries, pastries and egg products	2	1	0		
<b>Total</b>		<b>9</b>	<b>5</b>	<b>0</b>	<b>-4</b>	<b>3</b>
②	a Raw products (frozen or fresh)	4	3	0	/	/
	b Meat based products ready to reheat	2	2	0		
	c Raw and cooked delicatessen	1	3	0		
<b>Total</b>		<b>7</b>	<b>8</b>	<b>0</b>	<b>1</b>	<b>3</b>
③	a Raw milk cheeses	3	3	0	/	/
	b Other products based on raw milks	1	3	0		
	c Heat treated dairy products	2	1	0		
<b>Total</b>		<b>6</b>	<b>7</b>	<b>0</b>	<b>1</b>	<b>3</b>
④	a Raw products (fresh and frozen)	2	1	0	/	/
	b Pre-cooked vegetables, vegetables under modified atmosphere	4	2	0		
	c RTE	4	2	0		
<b>Total</b>		<b>10</b>	<b>5</b>	<b>0</b>	<b>-5</b>	<b>3</b>
⑤	a Raw products (fresh and frozen)	3	3	0	/	/
	b Cured & smoked	4	0	0		
	c Ready-to-eat, Ready to reheat	2	1	0		
<b>Total</b>		<b>9</b>	<b>4</b>	<b>0</b>	<b>-5</b>	<b>3</b>
⑥	a Process & cleaning waters	2	1	0	/	/
	b Dusts and residus	3	3	0		
	c Surface sampling	2	4	0		
<b>Total</b>		<b>7</b>	<b>8</b>	<b>0</b>	<b>1</b>	<b>3</b>
<b>Total</b>		<b>48</b>	<b>37</b>	<b>0</b>	<b>-11</b>	<b>6</b>

The observed values are below the acceptability limits for each category and for the combined categories.

The alternative method produces results comparable to the reference method.

### 3.1.9. Confirmation

For 19 samples in negative agreement, *Listeria monocytogenes* strains were recovered by the confirmation procedure. Four of them were artificially inoculated; all the other ones were naturally contaminated. In many cases, only few colonies were observed on the selective agars of the confirmation procedures of the alternative methods. 3 isolates were only recovered using the ISO

method protocol from the LESS Plus broth. This detection of *Listeria monocytogenes* only by confirmation tests may be due to the difference in volume used between detection (50 µl) and confirmation (100 µl).

Some differences were observed between streaking onto O&A agar and RAPID'L.*mono* plates and are given in Table 13.

*Table 13: Differences observed between streaking onto O&A agar and RAPID'L.*mono* plates*

Sample n°	O&A agar	RAPID'L. <i>mono</i>
<b>3804</b>	+	-
<b>3913</b>	+	-
<b>3918</b>	+	-
<b>4117</b>	+	-
<b>4119</b>	+	-
<b>4394</b>	-	+
<b>4397</b>	-	+
<b>5420</b>	+	-
<b>5890</b>	+	-

For 7 samples, typical colonies were observed on O&A plates while no typical colony was observed on RAPID'L.*mono*. For 2 samples, typical colonies were observed on RAPID'L.*mono* and not on O&A plates.

### 3.1.10. Inhibitions

The following inhibitions were observed: - after enrichment: table 14,  
- after storage of the broth at 2-8°C: table 15.

*Table 14: Inhibitions observed LESS Plus broth incubation*

Sample N°	Product	ANSR Result	Final result	Agreement
<b>1106</b>	<b>Rillettes</b>	i/+	+	PA
<b>1982</b>	<b>RTRHG (Moussaka)</b>	i/+	+	PA
<b>1983</b>	<b>Baccon</b>	i/+	+	PA
<b>1984</b>	<b>RTE (Macedoine)</b>	i/+	+	PA
2916	Custard	i/-*	-	NA
2917	Custard	i/-*	-	NA
<b>1117</b>	<b>RTRH (cheese ham)</b>	i/-	-	ND
6247	Raw ewe milk cheese	i/-	-	ND
3807	RTE (Surimi)	i/-*	-	NA
4397	Dusts (fish industry)	i/+-	+	PA
<b>1985</b>	<b>RTE (Grated carrots)</b>	i/-	-	ND

<b>5639</b>	<b>Ice cream (apricot, white chocolate)</b>	i/i/-*	-	NA
<b>5640</b>	<b>Ice cream (caramel)</b>	i/-	-	NA
<b>5641</b>	<b>Ice cream (caramel)</b>	i/-	-	NA
5924	Croque monsieur	i/-	-	NA
4393	Dusts (fish industry)	i/+/+	+	PD
<b>1979</b>	<b>Panna cotta</b>	i/i/-*	-	ND

Table 15: Inhibitions observed LESS Plus broth storage at 2-8°C

Sample N°	Product	ANSR Result	Final result	Agreement
3450	Pasteurized liquid whole egg	i/-*	-	NA
6247	Raw ewe milk cheese	i/-*	-	ND
<b>4282</b>	<b>RTE vegetables (beets)</b>	i/-/-	-	ND
<b>4286</b>	<b>RTE vegetables (celery)</b>	i/+/+	+	PD
5786	Ready to reheat fish	i/+	+	PA
5410	Rillettes	i/-	-	ND
<b>5979</b>	<b>Beets</b>	i/+	+	PA
<b>1979</b>	<b>Panna cotta</b>	i/-*/+*/*-	-	ND

Just after incubation of the LESS Plus broth, 17 inhibitions were observed; for 12 of them, the test was run again without any dilution. For 5 samples, a 1/10 dilution was applied.

After LESS Plus broth storage at 2 – 8°C, 8 inhibitions were observed; a result was obtained without applying any dilution for 5 samples, and with a 1/10 dilution for 3 samples.

25 inhibitions were observed for 790 tests applied; this represents 3.2 %.

### 3.2. Relative level of detection study

#### 3.2.1. Experimental design

Six matrix-strain pairs were analyzed by the reference method and by the alternative method (See Table 16):

Three levels of contamination were prepared consisting of a negative control level, a low level, and a higher level. Only one strain of the target analyte was used to contaminate the low and the high level.

The negative control level shall not produce positive results. Five replicates are tested for this level. The low level shall be the theoretical detection level, it has been contaminated at 0.7 - 1 CFU per test portion to obtain fractional recovery results. Twenty replicates are tested for this level.

The higher level shall be just above the theoretical detection level, it has been contaminated at 2 - 3 CFU per test portion. Five replicates are tested for this level.

Food samples were contaminated using the seeding protocol. Bulk contaminations were performed on the matrix for the different levels of contamination, then the matrix was stored at 4°C for 48 hours before analysis.

An enumeration of the mesophilic aerobic flora was performed on the matrices, as well as a detection of *Listeria* using the ISO 11290-1/A1 standard method to check the absence of *Listeria monocytogenes* in the matrices.

*Table 16: matrix-strain pairs used for the determination of the RLOD of the method*

Matrix	Strain	Origin
<i>Composite foods:</i> <b>Deli-salad (Piemontese salad)</b>	<i>Listeria monocytogenes</i> Ad494	Deli salad
<i>Meat products:</i> <b>Pâté</b>	<i>Listeria monocytogenes</i> Ad669	Rillettes
<i>Milk and Dairy products</i> <b>Raw milk cheese (Brie)</b>	<i>Listeria monocytogenes</i> Ad618	Cheese
<i>Vegetables:</i> <b>Ready-to-cook vegetables</b>	<i>Listeria monocytogenes</i> Ad279	Ready-to-cook vegetables
<i>Fish and seafood:</i> <b>Smoked salmon</b>	<i>Listeria monocytogenes</i> Ad670	Smoked salmon
<i>Environmental samples:</i> <b>Process water</b>	<i>Listeria monocytogenes</i> Ad551	Environmental sample

### 3.2.2. Results and calculation of the RLODs

Raw results are shown in Appendix F. The RLOD is defined as the ratio of the LODs of the alternative method and the reference method:  $\text{RLOD} = \frac{\text{LOD}_{\text{alt}}}{\text{LOD}_{\text{ref}}}$ .

The RLODs calculations were performed according to the standard ISO 16140-2:2016 using the Excel spreadsheet available for download at <http://standards.iso.org/iso/16140>. Values of the RLODs are presented in table 17.

For the deli salad, two assays were needed to have the required number of positive samples for the low contamination level (25 to 75 %). The determination of the RLOD was done only with the second assay.

*Table 17: RLODs values (RLOD: the estimated relative level of detection value, RLODU: the upper limit of the 95% confidence interval for RLOD, RLODL: the lower limit of the 95% confidence interval for RLOD, b=ln(RLOD): logarithm of the RLOD value, sd(b): standard deviation of b, z-Test statistic: absolute value of the test statistic of the z-Test with the null hypothesis H0: b=0, p-value: p-value of the z-Test)*

Category	RLOD	RLODL	RLODU	b=ln(RLOD)	sd(b)	z-Test statistic	p-value	AL
<b>1 Composite foods</b>	0,7	0,2	1,9	-0,4	0,5	0,7	1,5	2,5
<b>2 Meat products</b>	0,8	0,3	2,3	-0,2	0,5	0,3	1,3	
<b>3 Milk and dairy products</b>	0,9	0,3	2,5	-0,1	0,5	0,2	1,2	
<b>4 Vegetables</b>	0,6	0,2	1,6	-0,4	0,5	0,9	1,7	
<b>5 Fish and seafood</b>	1,9	0,7	5,0	0,6	0,5	1,3	0,2	
<b>6 Environmental samples</b>	0,8	0,3	1,9	-0,2	0,4	0,5	1,4	

The LOD<sub>50</sub> calculations according to Wilrich & Wilrich POD-LOD calculation program - version 11, are given in Table 18.

*Table 18: LOD<sub>50%</sub> for the alternative and reference method (CFU/25 g)*

Matrix	Strain	Reference method	Alternative method
Deli-salad	<i>L. monocytogenes</i>	0.764	0.547
Rillettes	<i>L. monocytogenes</i>	0.460	0.385
Raw milk cheese	<i>L. monocytogenes</i>	0.859	0.772
Ready-to-cook veg.	<i>L. monocytogenes</i>	0.870	0.620
Smoked salmon	<i>L. monocytogenes</i>	0.588	1.153
Process water	<i>L. monocytogenes</i>	0.874	0.694
<b>Combined results</b>		0.741	0.672

### 3.2.3. Interpretation and conclusion

The RLODs values are below the acceptability limit set at 2.5, meaning that, as stated in ISO 16140-2:2016, the maximum increase in LOD of the alternative versus the reference method is not considered as relevant in consideration of the fitness for purpose of the method.

In conclusion, alternative and reference methods show similar LODs values for the detection of *Listeria monocytogenes* in the categories tested.

## 3.3. Inclusivity and exclusivity study

### 3.3.1. Test protocols

50 *L. monocytogenes* strains, 30 *Listeria* spp strains and 20 non-target strains were tested by the ANSR method and by the reference method.

- **Inclusivity**

*L. monocytogenes* strain cultures were performed in BHI medium at 37°C. Dilutions were done in order to inoculate 10 cells/225 ml of LESS Plus broth (the LESS Plus broth was incubated for 24 h at 30°C), prior running the alternative method protocol.

- **Exclusivity**

Negative strain cultures were performed in BHI at 37°C. Dilutions were realized in order to inoculate  $10^5$  cells/ml in buffered peptone water. The broths were incubated for 24 h at 37°C. The alternative method single analysis protocol was then performed.

### 3.3.2. Results

Raw data are given in Appendix G.

- **Inclusivity**

The 50 target strains gave a positive result.

- **Exclusivity**

No cross reaction was observed among the 50 non-target tested strains.

### 3.3.3. Conclusion

The selectivity of the method is satisfactory

### 3.4. Practicability

The alternative method practicability was evaluated according to the AFNOR criteria relative to method comparison study.

- **Storage conditions, shelf-life and modalities of utilization after first use**

The storage temperature is: 2-8°C. The shelf-life is given on the package. All the reagents shall be stored at the temperature mentioned on the package.

- **Common step with the reference method**

No common step

- **Time-to-result**

See table below:

*Table 19: Time-to-result (1: rhamnose and xylose tests are realized in tubes)*

Steps	Reference method	Alternative method
<b>Negative samples</b>		
Sampling (Half Fraser or LESS Plus broth)	Day 0	Day 0
Fraser 1	Day 1	/
Lysis / ANSR test	/	Day 1
Half Fraser streaking (O1 – P1)	Day 1	/
Fraser 1 streaking (O2 – P2)	Day 3	/
Reading plates (O1 – P1)	Day 2 – Day 3	/
Reading plates (O2 – P2)	Day 4 – Day 5	/
<b>Presumptive positive or positive results</b>		
Sub-culture of typical colonies on TSAYE	Day 2 – Day 3	/
Streaking onto O&A or RAPID'L. <i>mono</i> plates	/	Day 1
O&A or RAPID'L. <i>mono</i> plates reading	/	Day 2 – Day 3
Confirmatory tests	Day 3 – Day 6	/
Results	Day 4 – Day 7 Day 8 – Day 11 <sup>(1)</sup>	/

## 4. Interlaboratory study

### 4.1. Organization of the study

Samples were sent to 15 laboratories. Cheese sample (Camembert, fat content: 21%, salt: 1.4 %) was inoculated with a *Listeria monocytogenes* strain.

Samples were prepared and inoculated on Monday 14 December 2015, as described below:

- BLUE LABEL: 24 blind coded samples for the detection of *Listeria monocytogenes* by the reference method (EN ISO 11290-1/A1),
- RED LABEL: 24 blind coded samples for the detection of *Listeria monocytogenes* by the ANSR method ,
- 1 sample for aerobic mesophilic flora enumeration by ISO 4833-1 method,
- 1 water flask labelled “Temperature Control” with a temperature probe for temperature control during transport and storage in the laboratory until the beginning of the analyses.

The targeted inoculation levels were the following:

- Level: 0 CFU/25 g,
- Level 1: 2 CFU/25 g,,
- Level 2: 8 CFU/25 ml

Blind coded samples were placed in isothermal boxes, which contained cooling blocks, and express-shipped to the different laboratories.

A temperature control flask containing a sensor was added to the package in order to register the temperature profile during the shipping, the package delivery and the storage until analyses.

Samples were shipped in 24 h to 48 h to the involved laboratories. The temperature conditions had to stay lower or equal to 8°C during shipping, and between 0°C – 8°C in the labs.

Collaborators and the Expert Laboratory carried out the analyses on Tuesday 15 December or Wednesday 16 December 2015 with the alternative and reference methods. The analyses by the reference method and the alternative method were performed on the same day.

The interlaboratory study instructions were sent on 24<sup>th</sup> November 2015.

### 4.2. Experimental parameters controls

#### 4.2.1. Sample stability

##### 4.2.1.1. Contamination levels before inoculation

The contamination rates and the estimated precisions are set out in the table below.

*Table 20: target and real contamination levels (CFU/25 g)*

Level	Samples	Theoretical target level	True level	Low limit	High limit
<b>Level 0 <math>L_0</math></b>	4-7-9-10-13-18-23-24	0	/	/	/
<b>Low level <math>L_1</math></b>	2-3-8-12-15-17-19-21	2	2.4	2.0	2.9
<b>High level <math>L_2</math></b>	1-5-6-11-14-16-20-22	8	9.6	7.8	11.8

#### 4.2.1.2. Strain stability during transport

In order to detect the presence of *Listeria monocytogenes*, the reference method was applied on five portions (25 g) before the inoculation. All the results were negative. Three samples inoculated at a high level (100 CFU/g) were tested for enumeration after 24 h and 48 h storage. Three samples inoculated at a low level were tested for detection after 24 h and 48 h storage (See table 21).

*Table 21: Listeria monocytogenes stability in the matrix*

Day of analysis	<i>Listeria</i> spp. detection		Mesophilic aerobic flora (CFU/g)
	CFU/g	Detection/25 g	
Day 0	140	+	6.3 10 <sup>7</sup>
	100	-	
	140	+

Day 2	170	+	1.9 10 <sup>8</sup>
	180	+	
	270	+	

#### 4.2.1.3. Logistic conditions

The temperatures measured at reception by the Labs, the temperatures registered by the thermo-probe, and the receipt dates are given in Table 22.

*Table 22: samples temperature upon receipt (T°C: temperature in °C)*

Laboratories	Probe T°C	Receipt T°C	Receipt date and time	Analysis date
A	3.0	3.3	15/12/2015 10h30	16/12/2015
B	2.0	4.0	15/12/2015 14h20	16/12/2015
C	2.5	4.2	15/12/2015 13h30	/
D	3.0	3.3	15/12/2015 10h05	15/12/2015

I	3.0	6.0	15/12/2015 15h50	16/12/2015
J	Not received	7.8	15/12/2015 12h00	/
K	3.5	4.3	15/12/2015 10h00	16/12/2015
L	3.0	4.2	15/12/2015 14h30	/
M	2.5	3.5	15/12/2015 13h15	16/12/2015
N	2.5	3.8	16/12/2015 11h00	16/12/2015
O	3.0	6.2	15/12/2015 12h20	15/12/2015

All the samples were delivered in appropriate conditions. Temperatures during shipment and at receipt were all correct.

### 4.3. Results

The raw data are given in Appendix H.

#### 4.3.1. Results obtained by the Expert Laboratory

The results obtained by the Expert Laboratory are the following (see table 23).

*Table 23: Results obtained by the Expert Laboratory*

Level	Reference method	Alternative method
		Single protocol
$L_0$	0 / 8	0 / 8
$L_1$	7 / 8	8 / 8
$L_2$	8 / 8	8 / 8

#### 4.3.2. Results obtained by the collaborators

- **Mesophilic aerobic flora**

The enumeration of the mesophilic aerobic flora varies from  $6.5 \cdot 10^6$  to  $4.6 \cdot 10^8$  CFU/g.

- **Reference method**

Table 24 presents the positive results of all collaborators

*Table 24: positive results of the collaborators (bc: before confirmation, ac: after confirmation)*

Lab	Reference method			Alternative method					
	$L_0$	$L_1$	$L_2$	$L_0$		$L_1$		$L_2$

O	0	7	8	0	0	7	7	8	8
Total	0	103	120	1	1	101	100	120	120

According to the AFNOR technical rules, it is possible to include the results from a collaborator with maximum one cross contamination at Level 0. For this study, this rule was not applied.

Two labs were not retained for interpretation:

- Lab B did not respect the incubation time for the LESS Plus broth (24 h at 30°C);
- Lab K found a control sample positive by the alternative method.

The results from 13 Labs were kept: A, C, D, E, F, G, H, I, J, M, N and O.

The results obtained by the collaborators in the interlaboratory study are summarized in Table 25.

*Table 25: positive results of the collaborators after having withdrawn labs B and K (bc: before confirmation, ac: after confirmation)*

Lab	Reference method			Alternative method

#### 4.4. Interpretation of the results

##### 4.4.1. Summary of the results

Table 26 details per method, per level and per protocol the results obtained during the study.

*Table 26: tests results for the two methods*

Response	Reference method positive (R+)	Reference method negative (R-)
Alternative method positive (A+)	Positive agreement PA = 77	Positive deviation PD = 11
Alternative method negative (A-)	Negative deviation ND = 13 including 1 PPND	Negative agreement NA = 3 including 0 PPNA

For Level 1, the negative deviations are listed in Table 27 and the positive deviations in Table 28.

For 5 samples, the confirmatory tests concluded to the presence of *Listeria monocytogenes* in the enrichment broth, while the ANSR test was negative. Note that for Lab I (sample I8), the test was repeated and finally gave a positive result. For 7 samples, the ANSR tests and the confirmatory tests were negative. For one sample (L19), the ANSR test was positive but the Lab did not confirm the presence of *Listeria monocytogenes* in the enrichment broth.

Table 27: negative deviations

The difference between (ND – PD) for the level where fractional recovery was obtained ( $L_1$ ) is calculated.

The observed value found for (ND – PD) shall not be higher than the acceptability limit (AL). The AL is defined as  $[(ND - PD)_{max}]$  and calculated per level where fractional recovery was obtained as described below using the following three parameters:

$$- (p+)_{ref} = \frac{P_x}{N_x}, \text{ where}$$

$P_x$  = number of samples with a positive result obtained with the reference method at level x, ( $L_1$  or  $L_2$ ) for all laboratories;

$N_x$  = number of samples tested at level x ( $L_1$  or  $L_2$ ) with the reference method by all laboratories.

$$- (p+)_{alt} = \frac{CP_x}{N_x}, \text{ where}$$

$CP_x$  = number of samples with a confirmed positive result obtained with the alternative method at level x ( $L_1$  or  $L_2$ ) for all laboratories;

$N_x$  = number of samples tested at level x ( $L_1$  or  $L_2$ ) with the alternative method by all laboratories.

-  $(ND - PD)_{max} = \sqrt{3N_x \times ((p+)_{ref} + (p+)_{alt} - 2((p+)_{ref} \times (p+)_{alt}))}$ , where  
 $N_x$  = the total number of samples tested for level x (L1 or L2) by all laboratories.

The AL is not met when the observed value is higher than the AL. When the AL is not met, investigations should be made (e.g. root cause analysis) in order to provide an explanation of the observed results.

Based on the AL and the additional information, it is decided whether the alternative method is regarded as not fit for purpose. The reasons for acceptance of the alternative method in case the AL is not met shall be stated in the study report.

In this study, fractional positive results are observed at level  $L_1$  only. The different parameters obtained by the calculation are detailed in the table below:

*Table 29: values obtained for the determination of the acceptability limit*

Parameter	Value
$N_x$	104
$(p+)_{ref}$	0.87
$(p+)_{alt}$	0.86
<b>Acceptability limit: <math>AL = (ND-PD)_{max}</math></b>	<b>8.65</b>
<b>Observed value: <math>ND-PD</math></b>	<b>2</b>

The value (ND-PD) is inferior to the acceptability limit for the two protocols, so the requirements of the standard ISO 16140-2:2016 are fulfilled.

#### 4.4.2. Calculation of sensitivities, relative accuracy and false positive ratio

Based on the data of table 27, the following parameters are calculated:

- Sensitivity for the alternative method:  $SE_{alt} = \frac{(PA+PD)}{(PA+ND+PD)} \times 100\%$

- Sensitivity for the reference method:  $SE_{ref} = \frac{(PA+ND)}{(PA+ND+PD)} \times 100\%$

- Relative accuracy:  $AC = \frac{(PA+NA)}{N} \times 100\%$

- False positive ratio for the alternative method:  $FP = \frac{(FP)}{NA} \times 100\%$

where N is the total number of samples (NA + PA + PD + ND) and FP is false positive results.

The results are the following:

$SE_{alt} = 87\%$

$SE_{ref} = 89\%$

$AC = 77\%$

$FP = 33\%$

#### **4.5. Evaluation of the LOD<sub>50%</sub>, LOD<sub>95%</sub> and RLOD**

This evaluation is performed according to Annex F of ISO 16140-2:2016 and using the excel spreadsheet as described in this standard. As there is limited experience with the interpretation of this approach, the results are used only for information. Results are shown in the table 30.

*Table 30: values obtained for the determination of the relative level of detection*

<b>Method</b>	<b>LOD<sub>50%</sub></b>	<b>LOD<sub>95%</sub></b>	<b>RLOD</b>
Reference	0.83 [0.65 ; 1.05]	3.57 [2.80 ; 4.56]	
Alternative	0.85 [0.67 ; 1.09]	3.69 [2.90 ; 4.71]	1.03 [0.78 ; 1.37]

## 5. Conclusion

- **Methods comparison study**

The method comparison study scheme corresponds to an UNPAIRED STUDY design as the alternative and reference methods do have different enrichment procedures.

In the sensitivity study, 6 categories were tested: 5 food categories and the environmental samples. The alternative method shows 42 positive deviations (PD) and 42 negative deviations (ND) for the overall categories. The values for  $((ND + PPND) - PD)$  are below or equal to the acceptability limits (AL) whatever the categories, and as well for the 6 tested categories.

The Relative Levels of Detection (RLOD) are all below the AL fixed at 2.5 for the unpaired data study whatever the matrix/strain pairs and the protocol.

The inclusivity and exclusivity testing did give the expected results for the 50 target strains and the 50 non target strains.

It is possible to store the primary enrichment broth for 72 h at 2-8°C.

The ANSR for *Listeria monocytogenes* allows a one-day screening of the negative samples.

The ANSR method for *Listeria monocytogenes* with the single protocol fulfils all the ISO 16140-2 and AFNOR technical rules requirements.

- **Interlaboratory study**

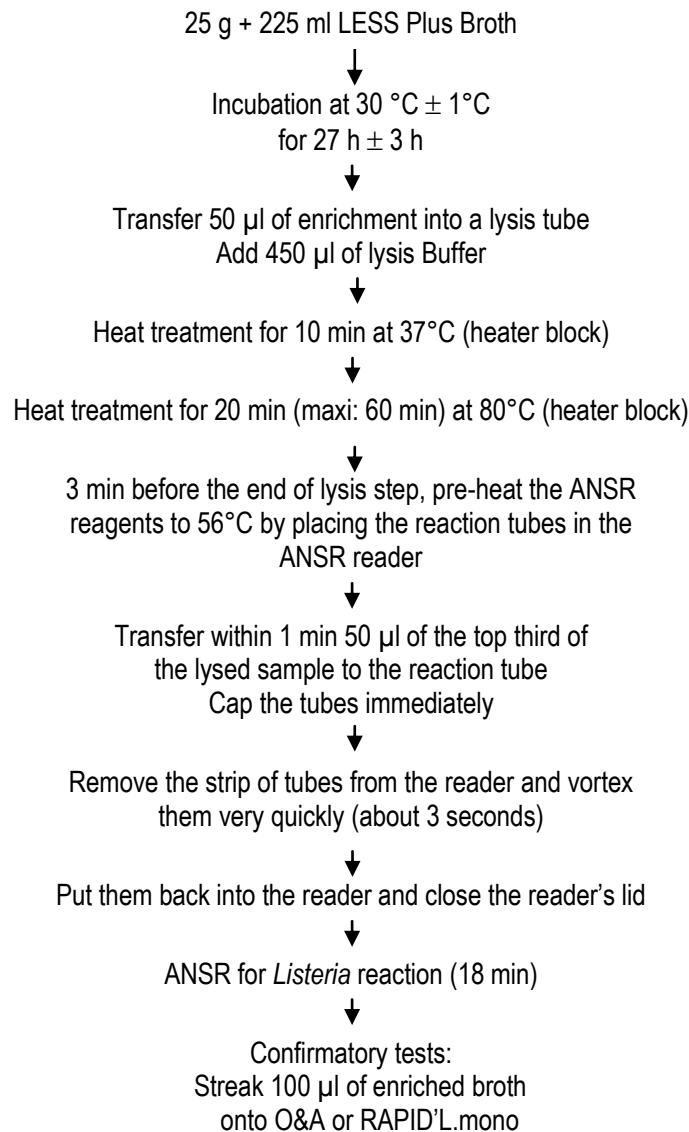

The data and interpretations comply with the ISO 16140-2:2016 requirements. The ANSR method for *Listeria monocytogenes* is considered equivalent to the ISO standard.

Le Lion d'Angers, December 18<sup>th</sup>, 2023  
François Le Nestour  
Head of the Microbiology Department

## Appendix D – Sensitivity study: raw data

### **Bold typing : artificially inoculated samples**

#### **Listeria detection results:**

- H-: characteristic Listeria colonies without halo
- H+: characteristic Listeria colonies with halo
- : no typical colonies but presence of background microflora
- st: plate without any colony
- i: PCR inhibition
- PA: positive agreement
- NA: negative agreement
- ND: negative deviation
- PD: positive deviation
- PPNA: positive presumptive negative agreement
- PPND : positive presumptive negative deviation
- NC: Non characteristic colony on TSYEA
- d: doubtful colony
- \*: 1/10 dilution
- \*\*: 1/100 dilution
- F1: Fraser 1
