NF VALIDATION - Validation of alternative method of analysis
Application to food microbiology

Summary Report

Study conducted according to EN ISO 16140-2 : 2016

« ALOA® ONE DAY »
AES 10/03-09/00
for the detection of *Listeria spp.* in human food products and environmental samples

Qualitative method

Expert laboratory :

SUMMARY

Preamble

Validation protocol :

ISO 16140-2 (September 2016): Microbiology of the food chain – Method validation - Part 2: Protocol for the validation of alternative (proprietary) methods against a reference method.

AFNOR Technical Rules (PR Revision 7).

Alternative method:

ALOA® ONE DAY, certificate n°AES 10/03-09/00

Reference method :

ISO 11290-1 (May 2017)

Scope:

All human food products and food production environmental samples

Certification organism:

AFNOR Certification (http://nf-validation.afnor.org/)

1. Introduction

The ALOA® / L. Monodisk method was validated by the Microbiology Technical Board of AFNOR Certification in September 2000 and was registered under the number 10/3-09/00. The different validation steps are summarized in the following Table:

Date	Etude	Subject	Standards
2000	Validation	- Validation of ALOA®/L. MONODISK method (for detection of *Listeria monocytogenes*)	EN ISO 11290-1 :1996
2010	Extension	- Extension for detection of *Listeria spp*, - Isolation of 0,1 mL or spreading of 0,1mL, - Two new confirmation protocols: sting on Palcam agar and immunochromatographic assay « *Listeria species* Confirmation Strip »	EN ISO 11290-1/A1 EN ISO 16140 :2003
2011	Extension	- Storage of half Fraser broth for 72h at 2-8°C, - Confirmation with RAPIDEC® mono, - Confirmation with API® *Listeria* and VIDAS® LMO2 test (recovery of previous validation data obtained with the OAA method)	
2012	Renewal	- Renewal without modification	
2013	Extension	- New confirmation protocol: « FAST Rhamnose »	
2015	Extension	- Extension of the agar incubation range to 22-24 hours for the detection of *Listeria monocytogenes* (range tested during initial validations in 2000, 2002 and 2005)	
2016	Renewal	- Renewal without modification, - Exclusion of raw ewe milk dairy products for use of ALOA® Confirmation	
2019	Renewal	- Renewal taking into account the specific requirements of ISO 16140-2:2016 and AFNOR validation V6	EN ISO 11290-1:2017 EN ISO 16140-2:2016
2023	Extension	- New protocol with Listeria Boost Broth (enrichment 18h) for all food products categories and environmental samples.	

2. Protocols

2.1. Alternative method

2.1.1. Principle of the alternative method

The ALOA® agar medium is a chromogenic medium enabling the detection of all *Listeria* strains by revealing all beta-glucosidase activity (round turquoise-blue colonies with regular edges) with the differentiation of *Listeria monocytogenes* and *Listeria ivanovii* through the formation of an evident halo of precipitation from the phospholipids cleaved by the specific phospholipase.

2.1.2. Protocol of the alternative method

The flow diagram of the alternative method is provided in Appendix 1.

The method is based on a preliminary phase of enrichment of the sample, followed by spreading or isolation on ALOA® agar.

2 enrichment protocols are available:

- **Protocol** ① (already validated): dilution to 1:10 in half-Fraser broth, incubation for 24h± 2h at 30°C ± 1°C
- **Protocol** ② (extension study in 2023): Dilution to 1:6 in Listeria Boost Broth, incubation for 21h±3h at 30°C +/- 1°C

It is possible to store the enrichment broth for 72 hours at 5°C ± 3°C prior to plate inoculation.

After incubation of the agar media for 24 to 48 hours at 37°C ± 1°C, *Listeria monocytogenes* form blue to blue-green colonies surrounded by an opaque halo. *Listeria* strains other than *Listeria monocytogenes* and *ivanovii* form round, regular blue to blue-green colonies without an opaque halo. *Listeria ivanovii* strains give blue to blue-green colonies, round, regular with or without an opaque halo.

In accordance with AFNOR Certification and manufacturer requirements, characteristic colonies must be subjected to confirmation tests:

For colonies characteristic of *Listeria spp* (blue to blue-green colonies surrounded or not by an opaque halo):
1- confirmation of a positive colony according to conventional tests using standardized methods, including a purification stage,
2- spot confirmation on Palcam agar of an isolated colony,
3- by the immuno-chromatography test RapidChek® Listeria species Food System,
4- by any other ISO 16140-2 certified method of which the principle is different from « ALOA® One Day » method. Both methods must have a common step.

2.1.3. Scope

All human food products and food production environmental samples.

2.2. Reference method

For this extension study, the reference method was the ISO 11290-1 (May 2017): Microbiology of the food chain - Horizontal method for the detection and enumeration of *Listeria monocytogenes* and of *Listeria spp.* - Part 1: Detection method".
The workflow of the method is set out in appendix 2.

2.3. Study design

For protocol ①**,** the study is a paired study design as the reference and the alternative methods have the same enrichment procedure.
For protocol ②**,** the study is an unpaired study design as the reference and the alternative methods have different enrichment procedures.

3. Initial validation and extension studies : results

3.1. Method comparison study

3.1.1. Sensitivity study

The sensitivity (SE) is the ability of the method to detect the analyte by either the reference or alternative method.

3.1.1.1. Number and nature of samples

In the previous validations, 802 samples were analyzed with protocol ①, providing 395 positive samples and 407 negative samples.

During 2023 extension study, 544 samples were tested with protocol ②, providing 310 positive results and 234 negative results.

Combining the different studies, 1346 samples were analyzed, 705 positive samples and 641 negative samples.

The repartition of samples, per category and type is presented in table 1 (protocol ①) et table 2 (protocol ②).

Table 1: number and nature of samples (*positives with at least one of the methods) – Protocol ①

Category	Type		Negative samples	Positive samples*	Total
Meat products	Raw meat (unfroaen, frozen)	M1	38	50	88
	Catering dishes and processed products	M2	11	10	21

3.1.1.2. Artificial contamination of samples

Artificial contaminations were performed using seeding or spiking protocol. No more than six positive results were obtained using the same strain.

Considering all the categories of the application scope and all protocols, 705 samples gave a positive result by at least one of the methods and **50.6 %** of them were naturally contaminated.

The detail of the artificial contaminations is in appendix 3 and the repartition of the positive samples per contamination level is given in tables 3 and 4.

Table 3: Repartition of the positive samples (per protocol)

	Naturally contaminated	Artificially contaminated						Total
		Seeding (CFU/sample)			Spiking (CFU/sample)			
		≤3	3<x ≤10	10<x ≤30	≤5	5<x ≤10	10<x ≤30	
Nber of positive samples①	236	48	17	3	27	59	5	395
% protocol ①	59.7	12.2	4.3	0.8	6.8	14.9	1.3	100
Nber of positive samples ②	121	164	10	0	15	0	0	310
% protocol ②	39	52.9	3.2	0.0	4.9	0.0	0.0	100

Table 4: Repartition of the positive samples (all protocols)

	Naturally contaminated	Artificially contaminated						Total
		Seeding (CFU/sample)			Spiking (CFU/sample)			
		≤3	3<x ≤10	10<x ≤30	≤5	5<x ≤10	10<x ≤30	
Number of positive samples	357	212	27	3	42	59	5	705
%	50.6	30.1	3.8	0.4	6.0	8.4	0.7	100

The proportions of *Listeria* spp. (only or mixed with *L. monocytogenes*) and of *L. monocytogenes* among the positive samples for all categories are presented in tables 5 and 6.

Table 5 : Distribution of contamination - protocol ①

Category	Positive samples	L.spp only (A)	L.mono + L.spp (B)	Total A + B	L.mono only
Meat products	106	26	24	50	56

3.1.1.3. Protocols applied

- Study performed in 2010

  - Sample diluted 1/10 in half-Fraser and incubation for 24 hours +/- 2 hours at 30°C.
  - Surface isolation of 0.1mL on ALOA®.
  - Incubation at 37±1°C for 24 hours,
  - Storage of ALOA® for 48h à 2-8°C.
  - Confirmation by :
    - *Listeria spp* by :
      - Standard assays
      - Rapid check Listeria (immuno chromatography)
      - Spot on Palcam

- Study performed in 2016

  - Sample diluted 1/10 in half-Fraser and incubation for 22 hours 30°C.
  - Surface isolation of 0.1mL on ALOA®.

- Incubation at 37±1°C for 24 hours and 48 hours when needed,
- Storage of positive broths for 72h at 2-8°C and storage of ALOA® for 48h at 2-8°C.
- Confirmation by :
  - *Listeria spp*:
    - Standard assays
    - Rapid check Listeria (immuno chromatography)
    - Spot on Palcam

- Study performed in 2019

  - Sample diluted 1/10 in half-Fraser and incubation for 22 hours 30°C.
  - Surface isolation of 0.1mL on ALOA® (old and new formulations).
  - Incubation at 37±1°C for 22 hours and 48 hours,
  - Storage of positive broths for 72h at 2-8°C and storage of ALOA® for 48h at 2-8°C.
  - Confirmation :
    - *Listeria spp* by:
      - Standard assays
      - Rapid check Listeria (immuno chromatography)
      - Spot on Palcam

In addition, all negative broths of the alternative method were transferred into the Fraser broth of the reference method (0.1ml), incubated for 24h ± 2h at 37 ± 1°C, and then isolated on PALCAM and ALOA®.

- Study performed in 2023

  - Sample diluted 1/6 in **Listeria Boost Broth** and incubation for 18 hours at 30°C.
  - Surface isolation of 0.1mL on ALOA®
  - Incubation at 37±1°C for 24 hours and 48 hours,
  - Storage of positive broths for 72h at 2-8°C and storage of ALOA® for 48h at 2-8°C.
  - Confirmation by :
    - *Listeria spp* by:
      - API Listeria strip
      - RapidChek® Listeria species Food System

In addition, all negative broths of the alternative method were transferred into the Fraser broth of the reference method (0,1ml), incubated for 24h ± 2h at 37 ± 1°C, and then isolated on PALCAM and ALOA®.

3.1.1.4. Results

Raw data are shown in appendix 4 (protocol ①) and appendix 5 (protocol ②).
The results are given in the following tables 7 and 8 (protocol ①) and table 9 (protocol ②). For protocol ②**,** results are the same for reading 24h and reading 48h.

Sensitivity reference method (SE_{ref})	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100\ \%$	99.5%	99.1%	88.4 %
Relative Trueness (RT)	$RT = \frac{(PA + NA)}{N} \times 100\ \%$	98.6%	99.3%	86.9 %
False positive ratio (alternative method) (FPR)	$FPR = \frac{FP}{NA} \times 100\ \%$	0.7%	0.0%	0.9%

3.1.1.6. Analysis of discordant results

Positive deviations

A positive result is obtained by the alternative method whereas a negative result is obtained by the reference method.

In the previous validations, 2 positive deviations have been obtained after 22 and 48 hours of incubation.

For 2023 extension study, 36 positive deviations were observed, 19 on artificially contaminated samples and 17 on naturally contaminated samples.
Due to the difference of sampling between both methods, no cell of *L. spp* may have been taken in the sampling for the reference method.

Positive deviations are listed in Tables 14 and 15.

Negative deviations

A positive result is obtained by the reference method whereas a negative result is obtained by the alternative method.

In the previous validations, 9 negative deviations have been obtained after 24 hours of incubation, and 1 after 48 hours of incubation. For 5 samples (71-2010, 13-2019, 367-2010, 473-2010 and 39-2019), the reference method was only positive after the Fraser broth.

For 2023 extension study, 35 negative deviations were observed, 20 on artificially contaminated samples and 15 on naturally contaminated samples.

Due to the difference of sampling between both methods, and the use of contaminated samples with low levels of contamination, no cell of *Listeria spp* may have been present in the sampling of the alternative method.

For 6 samples in negative deviation (36, 74, 261, 316, 372, 417), a positive result was obtained with the reference method only by the fraser route.

For two samples in negative deviation (155 and 259), the presence of *Listeria spp* was confirmed in the Listeria Boost Broth with a subculture in Fraser broth.

Negative deviations are listed in Tables 14 and 15.

The analysis of discordant results according to the EN ISO 16140-2:2016 is presented in Table 16 and 17 for protocol ①, and in Table 18 for protocol ②.

The observed values (ND – PD) are below the acceptability limit for each category and for all categories, for all protocols, for the both incubation time (24h and 48h).

3.1.1.7. Storage of broths

All positive and discordant broths from 2016, 2019 and 2023 studies were stored for 72 h at 2-8°C.
For one sample (97) with protocol ①, *L. innocua* was only detected after 24 hrs of incubation of ALOA when *L. innocua* + *L. monocytogenes* were detected after 48 of incubation or after storage of the broth at 2-8°C. This change did not impact the final result.
Table 19 shows the 2 changes observed after storage.
For sample 97, *L. innocua* was only detected after 24 hrs of incubation of ALOA when *L. innocua* + *L. monocytogenes* were detected after 48 of incubation or after storage of the broth at 2-8°C. This change did not impact the final result.

Table 19: Results after enrichment storage for 72h at 2-8°C

Year	Sample Nb	Sample type	Result before storage		Result after storage	
			ALOA 24 h	ALOA 48 h	ALOA 24 h	ALOA 48 h
2016	97	C3	PA *L. innocua*	PA *L. innocua* + *L. monocytogenes*	PA *L. innocua* + *L. monocytogenes*	PA *L. innocua* + *L. monocytogenes*
2023	158	V1	NA	NA	PD	PD

The analysis of discordant results after storage is presented in Table 20 for protocol ② (no change with protocol ①).

3.1.1.8. Storage of ALOA®

All the agar from the 2010, 2016, 2019 and 2023 studies, were stored for 48 hours at 2-8°C and no change was observed.

3.1.1.9. Confirmations

All the confirmation tests implemented during this extension study were concordant. For 5 samples (3 with protocol ① and 2 with protocol ②), doubtful colonies were observed after 24h of incubation. As the confirmation was negative, the results were considered as PPNA (presumptive positive negative agreement).

For one sample (103) *Listeria monocytogenes* and *Listeria innocua* were confirmed by reference method while only *Listeria monocytogenes* was confirmed by alternative method. However Final result was PA (positive agreement).

For 3 samples negative with alternative method (155,158 and 259), the presence of *Listeria spp* was confirmed with a subculture in Fraser broth.

3.1.2. Relative level of detection

The relative level of detection (RLOD) is defined as the level of detection at P = 0.50 (LOD50) of the alternative (proprietary) method divided by the level of detection at P = 0.50 (LOD50) of the reference method.

The RLOD is defined as the ratio of the alternative and the reference method :

$$RLOD = \frac{LOD_{alt}}{LOD_{ref}}$$

3.1.2.1. Experimental design

For each protocol, matrix-strain couples were studied in parallel by both methods. For each category of the scope, one relevant type of food product is selected. Three levels of contamination per type were prepared consisting of a negative control level, a low level, and a higher level. Only one strain of the target analyte is used to contaminate the low and the high level.

The negative control level shall not produce positive results. Five replicates are tested for this level.

The low level shall be the theoretical detection level, providing fractional recovery results. Twenty replicates are tested for this level.

The higher level shall be just above the theoretical detection level. Five replicates are tested for this level.

Food products were contaminated using the seeding protocol. Bulk contaminations were performed on the matrices for the different levels of contamination, then the matrices were stored at 5±3°C for two or three days before analysis. Samples were then analyzed by the reference and the alternative method (enrichment time 18h).

Simultaneously, a total viable count was performed on a portion of non-contaminated matrix to estimate the concentration of mesophilic aerobic flora. A detection of *Listeria monocytogenes* using the reference method was also performed to check the absence of the target analyte in the matrix.

Table 21 details the couples matrix-strain tested.

Table 21: couples matrix-strain used for the determination of the RLOD

3.1.2.2. Results

Raw results are shown in appendix 6 (protocol ①) and appendix 7 (protocol ②).

The RLODs calculations were performed according to the standard ISO 16140-2: 2016 using the Excel spreadsheet available for download at http://standards.iso.org/iso/16140. Values of the RLODs are presented in table 22 (protocol ①) and table 23 (protocol ②).

Table 22: RLODs values for the six categories with protocol ①

(RLOD: the estimated relative level of detection value, RLODU: the upper limit of the 95% confidence interval for RLOD, RLODL: the lower limit of the 95% confidence interval for RLOD, b=ln(RLOD): logarithm of the RLOD value, sd(b): standard deviation of b, z-Test statistic: absolute value of the test statistic of the z-Test with the null hypothesis H0: b=0, p-value: p-value of the z-Test)

3.1.3. Inclusivity/Exclusivity

Inclusivity is the capacity of the alternative method to detect the target analyte from a wide range of strains. Exclusivity is the absence of interferences from an appropriate range of untargeted strains by the alternative method.

3.1.3.1. Tests protocols

- **During the previous validations**

Inclusivity :

Each strain was inoculated in a nutrient broth incubated for 24 hours at 37°C. The cultures were then used to inoculate 225 mL of Half-Fraser broth at a concentration of about 10 à 100 CFU/ml and the broth was incubated for 22 hours at 30°C.
After enrichment, 0,1 ml of Half-Fraser broth was spreaded onto ALOA® and the plates were incubated for 22 hours at 37°C.

Exclusivity :

Each strain was inoculated in a nutrient broth incubated for 24 hours at 37°C. The cultures were then used to inoculate a non-selective broth at about 10^6 CFU/ml and the broth was incubated for 24 hours at 37°C.
After enrichment, 0,1 ml of the broth was spreaded onto ALOA® and the plates were incubated for 24 hours at 37°C.

- **During 2023 extension study**

The new protocol ② of the extension study was considered as more selective than the protocol ①, it was proposed to proceed to a new inclusivity study.

Fifty target strains were analyzed by the alternative method with the new protocol ② (20 *Listeria monocytogenes* and 33 *Listeria* other than *monocytogenes*).

125 mL of Listeria Boost broth were inoculated with 10 to 100 cells of *Listeria monocytogenes* The complete protocol of the alternative method was then applied after an incubation at the minimum enrichment time of the alternative method (18 h).

Positive results were confirmed by RapidChek® Listeria species Food System.

3.1.3.2. Results

Initial validation (2000) of « ALOA® / L. Monodisk » method for detection of *Listeria monocytogenes* (Appendix 8) :

All the 50 *Listeria monocytogenes* strains tested positive.
All the 51 non *Listeria monocytogenes* strains tested negative except few *Listeria ivanovii* strains presenting a slight halo after 24 h. The confirmation tests allowed to differentiate the two species.

Study performed in 2005 - renewal and extension study of « ALOA® One Day » method for the detection of *Listeria monocytogenes* (Appendix 9) **:**

All the 50 *Listeria monocytogenes* strains (food origin or strain library) tested positive.

All the 30 non-*Listeria monocytogenes* strains tested negative except few *Listeria ivanovii* strains characteristic with a slight halo after 24 h of incubation. After 48 hours, *Listeria ivanovii* can show the same characteristics as *Listeria monocytogenes.*

Study performed in 2006 by ISHA - extension study of « ALOA® One Day » method for the detection of *Listeria monocytogenes* , for validation of the confirmation protocol « ALOA® Confirmation » (Appendix 10) **:**

Target strains :
All the 152 target strains tested presented typical colonies on ALOA® after 24 hours of incubation (including the non-hemolytic strain tested). No discordant results between ALOA® and ALOA® Confirmation were observed.

Non target strains :
One hundred non-target strains, including 27 *Listeria ivanovii* strains, were tested and gave results in agreement with those expected. All the *Listeria ivanovii* strains tested were typical on ALOA® after 48 hours of incubation. However, the strains were not confirmed as *Listeria monocytogenes* using the ALOA® Confirmation test and they were identified as *Listeria ivanovii* using the identification tests of the reference method.

Study performed in 2010 - extension study of « ALOA® One Day » method for the detection of *Listeria monocytogenes* and *Listeria* spp and extension for the use of the *Listeria* species Confirmation Strip and the Palcam spot test for confirmation of presumptive positive colonies (Appendix 11)***:***

Sixty-three pure *Listeria* strains (20 *Listeria monocytogenes* and 43 *Listeria* non-*monocytogenes*) from strain collection or food products and 32 non-*Listeria* strains were tested. The non-target strains are known either to interfere with *Listeria spp* or to be naturally present in the food products tested

The 63 *Listeria spp* strains presented a positive response.

All of the strains were confirmed using the immunochromatographic test (*Listeria* species Confirmation Strip) and the spot test on Palcam.

The 32 non-target strains all presented negative results (either the absence of colonies, or non-characteristic colonies).
None of these strains were confirmed using the immunochromatographic test (*Listeria* species Confirmation Strip). Certain strains, notably *Bacillus*, developed on Palcam agar, but they were not typical of *Listeria*.

The confirmation test results obtained from the *Listeria* species Confirmation Strip and the Palcam spot tests corresponded to the expected results.

Study performed in 2023 - extension study of « ALOA® One Day » method for the detection of *Listeria monocytogenes* with protocol ② in *Listeria* Boost Broth (Appendix 12)***:***

All target strains were detected by the alternative method.

Note that for 7 strains (4 *Listeria ivanovii,* 2 *Listeria welshimeri and 1 Listeria grayi*), RapidChek® Listeria species test gave a weak positive result.

3.2. Praticability

Practicability is studied on the basis of the 4 criteria defined by the Technical Bureau:

1 - *Storage conditions and shelf-life of unopened products*
The storage temperature for ALOA® agar is stated on the manufacturer's technical instructions: 2°C to 8°C.
The use-by date is indicated on the underside of ALOA® agar plates. It allows 10 weeks after manufacture.
The use-by date is also indicated on each vial.
Plates poured by the user laboratory from ready-to-use vials can be stored for one week at 2°C to 8°C.

2 - *Conditions for use after first use*
Not applicable for pre-poured ALOA® agar plates.

The conditions for use after first use are specified in the manufacturer's technical data sheet.
Specifically:
Plates poured by the user laboratory from ready-to-use vials can be stored for one week at 2°C to 8°C.
Vials of non-supplemented ALOA® Base may be subjected to two regeneration and supercooling cycles without any reduction in the analytical quality of the results obtained using the alternative method.

3 - *Time-to-results*

Steps	Lead time obtained Reference method EN ISO 11290-1	Lead time obtained Alternative method ALOA® One Day*
Dilution in half-Fraser broth	D0	D0
Inoculation of Fraser broth	D1	-
Isolation on selective agar media Spreading / isolation on ALOA®	D1-D2 -	- D1
Availability of negative results (no characteristic colonies)	D3-D4	D2
Availability of positive results (characteristic colonies) **or negative after confirmation** Confirmation of *Listeria spp.* - Standardized tests - Palcam spot - RapidChek® Listeria species	 D4 to D6 - -	 D3 to D5 D3 D2

4- Steps in common with the reference method
One step in common with the reference method with protocol ①: primary enrichment.
No common step with the reference method with protocol ②.

3.3. Interlaboratory study

The aim of the inter-Laboratory study is to determine the variability of the results obtained in different laboratories using identical samples and to compare these results with those obtained in the methods comparison study.

3.3.1. Study organization

The inter-laboratory study was conducted in 2006 with 14 participating laboratories. The analyses were performed on samples of pasteurized goat's milk, artificially contaminated with a strain of *Listeria monocytogenes* 4b (isolated from unpasteurized goat's cheese).

3.3.2. Monitoring of experimental parameters

3.3.2.1. Stability of the strain and of the background flora

Stability of the *Listeria monocytogenes* strain in food samples was tested each day during 3 consecutive days, using samples contaminated at the L2 level and stored at 2-8°C.
Enumerations were performed using 6mL of undiluted sample inoculated on 6 ALOA 140 mm plates.

The following results were found for *Listeria monocytogenes*:

Day	CFU / 6 mL
D0	9
D1	7
D2	6
D3	10

The following results were found for the background flora:

Day	CFU / mL
D0	4000
D1	4300
D2	3800
D3	3400

Results showed no significant evolution of the *Listeria monocytogenes* strain as well as of the background flora during 3 days of storage.

3.3.2.2. Level of contamination

The contamination levels and their confidence intervals are showed in the following Table:

Level	Target (CFU / 25 mL)	True level (CFU / 25 mL)	Confidence interval (CFU/25 mL)
L0	0	0	/
L1	3	3,7	[1 - 8]
L2	30	35,4	[24 - 48]

3.3.2.3. Temperatures during the shipment and at reception and delay of reception

The receipt date, the temperatures measured at receipt, the temperatures registered by the thermo-probe and the conformity of the package are given in the following Table.

Laboratories	Date of receipt	Temperature at receipt	Thermo-probe	Conformity
A	13/06/2006 - 9h	7,2°C	4,5°C to 7,5°C	Conform
B	13/06/2006-8h50	5,2°C	4,5°C to 7,5°C	Conform
C	13/06/06 - 11h30	6,7°C	3,5°C to 8,5°C	Conform
D	13/06/06 - 10h50	6,3°C	4°C to 8,5°C	Conform
E	13/06/06 - 8h30	5,8°C	5°C to 8,5°C	Conform
F	13/06/06 - 11h	5,1°C	-1,5°C to 5,5°C	Conform
G	13/06/06 - 10h45	2,8°C	1°C to 8,5°C	Conform
H	13/06/06 - 8h45	3,8°C	5°C to 9°C	Conform
I	13/06/06 - 7h30	6,8°C	5,5°C to 8,5°C	Conform
J	13/06/06 - 11h15	8,0°C	6,5°C to 9,5°C	Conform
K	13/06/06 - 13h45	7,5°C	3,5°C to 8°C	Conform
L	13/06/06- 10h40	5,0°C	4,5°Cto 9,5°C	Conform
M	13/06/06 - 11h15	8,0°C	5,5°C to 8,5°C	Conform
N	13/06/06 - 10h30	6,8°C	4,5°C to 9°C	Conform
Expert	13/06/06 - 8h45	3,0°C	0°C to 7°C	Conform

The highest temperature values registered by the thermoprobe TOMPROBE^{TM}, corresponded to the temperature at the time of the package preparation. Then, the temperature was close to the minimum values. Taking into account this information as well as the temperature measured at arrival, all the Labs were included in the study.

3.3.3. Results

3.3.3.1. Results obtained by the expert Lab.

Results are shown in Table 26.

Table 26: positive results obtained by the expert Lab.

Inoculation level	Alternative method	Reference method
L0	0/8	0/8
L1	8/8	8/8
L2	8/8	8/8

3.3.3.2. Results obtained by the collaborators

- **Enumeration of mesophilic flora**

Overall, values of total viable count were between 1.0 10^3 and 5.0 10^4 CFU/g, average 2.1 10^4 CFU/g.

- **Detection of *Listeria monocytogenes***

Results obtained by the 14 collaborators are summarized in Table 27 for the reference method and in Table 28 for the alternative method.

Table 27: positive results obtained with the reference method

3.3.3.3. Results of the collaborators retained for interpretation

Collaborator A was excluded because of a proven inter-contamination of one negative sample by a positive sample.
Thirteen laboratories were finally kept for statistical analysis and their results are provided in Table 29 for the reference method and in Table 30 for the alternative method.

Table 29: positive results obtained with the reference method

3.3.4. Calculations and interpretation

3.3.4.1. Specificity (% SP)

Specificity values (SP), determined for both methods, using L0 results before and after confirmation are presented in Table 31.

Table 31: Specificity results

Reference method	$SP_{ref} = \left(1 - \left(\frac{P_0}{N\_}\right)\right) x\ 100\ \% =$	100%
Alternative method	$SP_{alt} = \left(1 - \left(\frac{CP_0}{N\_}\right)\right) x\ 100\ \% =$	100%

N_ : number of all results at level L0
P_0 : Total number of false positive results at level L0 before confirmation
CP_0 : Total number of false positive results at level L0

3.3.4.2. Sensitivity (SE), relative trueness (RT) and false positive ratio for the alternative method (FPR)

No fractional positive results were obtained at level L1 or L2. Table 32 shows results obtained at L1 level for the 13 collaborators.

Table 32: Results obtained at level L1 (PA : positive agreement, NA : negative agreement, PD : positive deviation, ND : negative deviation)

		Reference method positive (R+)	Reference method negative (R-)
Level L1	Alternative method positive (A+)	PA (A+/R+) = 104	PD (A+/R-) = 0
	Alternative method negative (A-)	ND (A-/R+) = 0	NA (A-/R-) = 0

Sensitivity values, relative trueness values and false positive ratio for the alternative method are shown in Table 33.

Table 33: Statistical interpretation for results obtained at level L1

	According to EN ISO 16140-2	Results (%)
Sensitivity (alternative method) (SE_{alt})	$SE_{alt} = \frac{(PA + PD)}{(PA + ND + PD)} \times 100\ \%$	100 %
Sensitivity (reference method) (SE_{ref})	$SE_{ref} = \frac{(PA + ND)}{(PA + ND + PD)} \times 100\ \%$	100 %
Relative trueness (RT)	$RT = \frac{(PA + NA)}{N} \times 100\ \%$	100 %
False positive ratio for the alternative method (FPR)	$FPR = \frac{FP}{NA} \times 100\ \%$	/

3.3.4.3. Data interpretation

For paired study data, the difference (ND-PD) and the sum (ND+PD) must be calculated at the level where fractional positive results are obtained and the values are compared to acceptability limits AL.

In this study the following results were obtained:

	Calculated values	AL	Conclusion
ND - PD	0	4	ND – PD < AL
ND + PD	0	5	ND + PD < AL

Performance of the Alternative method and of the Reference method are equivalent.

3.3.4.4. Determination of the relative level of detection

This evaluation is performed according to the EN ISO 16140-2 : 2016 Excel spreadsheet available at https://standards.iso.org/iso/16140/-2/ed-1/en/RLOD_inter-lab-study_16140-2 AnnexF_ver1_28-06-2017.xls.

Calculations are not possible as all the inoculated samples gave positive results by both the reference and the alternative methods.

3.4. Conclusion

- **Comparative study**

2 protocols are available for all food categories and environmental samples with ALOA® ONE DAY method, one with enrichment in Half Fraser broth (protocol ①) and one with enrichment in Listeria Boost broth (protocol ②).

802 samples were tested with protocol ①. 2 positive deviations and 9 negative deviations were obtained after 24 h of incubation, and 2 positive deviations and 1 negative deviations after 48h of incubation. Values (ND-PD) and (ND+PD) met the acceptability limits for each category and all combined categories.

544 samples were tested with protocol ②. 36 positive deviations and 35 negative deviations were observed. The observed values for (ND-PD) meet the acceptability limits for each category and all combined categories.

The Relative Levels of Detection (RLOD) are all bellow the acceptability limits, with protocols ① and ②.

Alternative method is specific and selective.

It is possible to store the enrichment broth for 72 hours at 5°C ± 3°C and the plates for 48 hours at 5°C ± 3°C.

The alternative method fulfils all the ISO 16140-2:2016 criteria and AFNOR technical rules (PR revision 7).

- **Interlaboratory study**

Results obtained by 13 collaborators showed equivalent performance between the alternative method and the reference method.

Appendices

APPENDIX 1

« ALOA® One Day » method

DETECTION OF *LISTERIA SPP*
« ALOA® One Day » METHOD

PROTOCOL ① : X g ou X ml of test sample + 9 X ml Half-Fraser broth

PROTOCOL ② : X g ou X ml of test sample + 5 X ml Listeria Boost broth

Protocol ① **:** 24 ± 2 hours at 30 ± 1°C
Protocol ② : 21 ± 3 hours at 30 ± 1°C

Possibility to store the broth for 72 hours at 5 ± 3°C, after incubation

0,1 ml isolation or spreading on ALOA®
Spreading : maintain a non inoculated area around the plate.
This area facilitates the observation of halos for loaded boxes

24 hours to 48 hours, at 37 ± 1°C

typical colonies?

YES
With / without halo

Presumption
L. spp

Confirmation (at the choice) :
- Confirmation tests of the reference method,
- Spot on Palcam,
- RapidChek® Listeria species Food System,
- Other AFNOR validated method using a different principle.

NO

Absence of
Listeria spp.

YES
with halo

Presumption
L. monocytogenes

Confirmation (at the choice) :
- Confirmation tests of the reference method,
- protocol « ALOA® Confirmation »,
- protocol « RAPIDEC Lmono »,
- protocol VIDAS LMO2
- API® Listeria strip
- test « FAST Rhamnose »,
- Other AFNOR validated method using a different principle.
